

The Biology of Deployment Trauma: Blood-based Biomarkers and the Diagnosis of a Complex Multi-Morbid Condition

Meghan Pierce, Ph.D.

Translational Research Center for TBI and Stress Disorders

VA Boston Healthcare System

Poll: How much experience do you have working with blood-based biomarkers related to traumatic brain injury?

a) I am currently working with blood-based biomarkers related to brain injury.

b) I am planning on including blood-based biomarkers in my research.

c) I work with patients with brain injury.

d) I am interested in the topic but do not have directly related experience.

Translational Research Center for TBI & Stress Disorders (TRACTS)

- Ongoing comprehensive assessment of post-9/11 Veterans.
 - 2009 – present
 - 2 sites: Boston & Houston (combined $n = 850$)
 - Longitudinal: Baseline, ~1-year ($n = 322$) and 5-year follow-ups ($n = 89$)
- Extensive longitudinal cohort study focused on the impact of traumatic brain injury (TBI) and common clinical comorbidities that impact functional outcomes.
 - Clinical Interviews
 - Medical/biological evaluation
 - Neuropsychological Assessments
 - Structural and Functional Brain Imaging

TRACTS Core Assessment at Baseline, 1-year, and 5-year Visits.

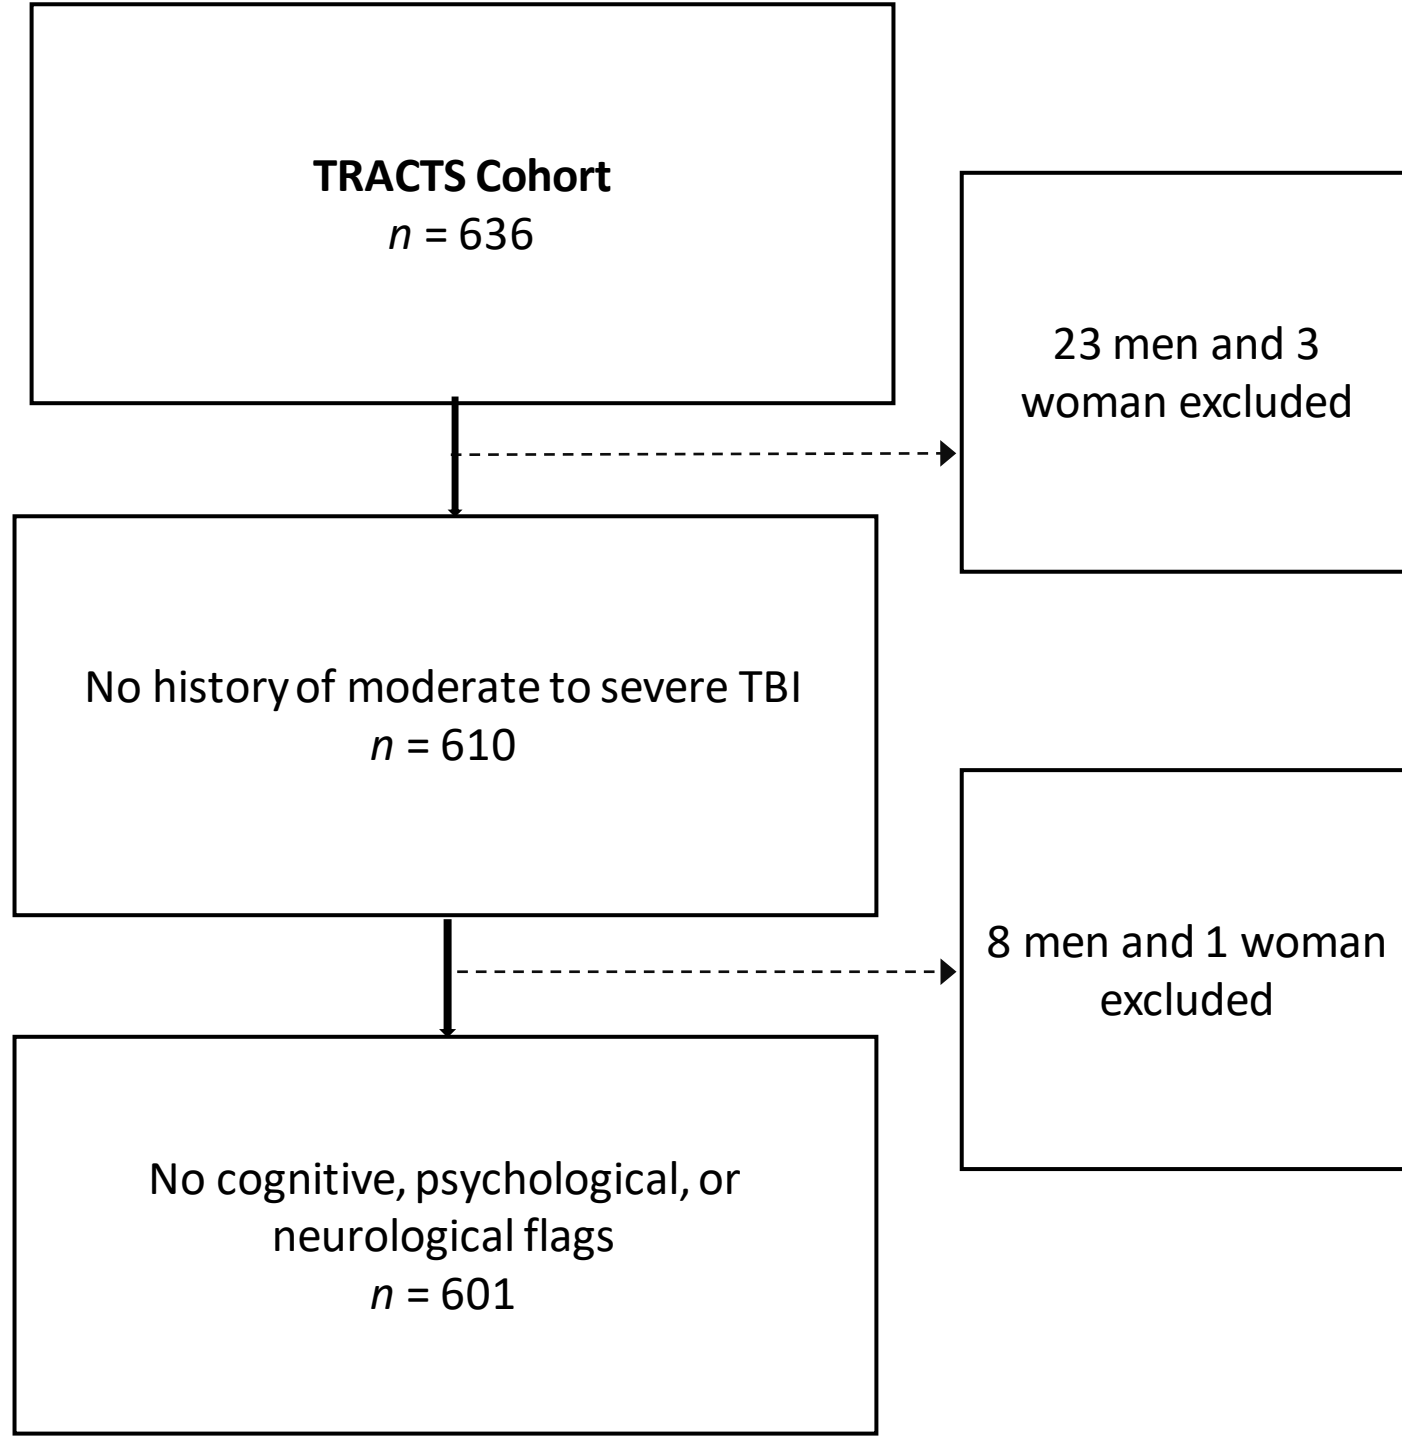

| Medical/Biological | Neuropsych Domains | Affective/Psychosocial | Blast/TBI | Neuroanatomy S/F MRI |
|----------------------|-------------------------------|--|-----------------------------------|-------------------------|
| Blood Chemistry | Simple/Divided Attention | PTSD: CAPS & PCL-C | Boston Assessment of TBI-Lifetime | Cortical Volume |
| GWAS | Information Processing Speed | DSM-IV AXIS I: SCID | Ohio State University TBI ID | Cortical Thickness |
| Neuro-steroid | Executive Function | Traumatic Life Events Questionnaire | Neurobehavioral Symptom Inventory | Diffusion Tensor |
| Neural Injury | Declarative/Procedural Memory | Deployment Risk & Resiliency Inventory | | Resting-State Networks |
| | Pre-morbid Function | Depression, Anxiety & Stress Scale-21 | | Functional Connectivity |
| | Perception | Pittsburg Sleep Quality Index | | Task-Based fMRI |
| | Symptom Validity | McGill Pain Questionnaire | | |
| | Psychomotor Speed | Alcohol, Nicotine | | |

How we measure TBI Severity

| Criteria | Mild | | | Moderate | Severe |
|-----------------------------|----------------|-----------------------------|------------------------------|--|------------|
| | Grade I | Grade II | Grade III | | |
| Loss of Consciousness | None | < 5 minutes | > 5 minutes and < 30 minutes | > 30 minutes and < 24 hours | > 24 hours |
| Alteration of Mental Status | 0 – 15 minutes | > 15 minutes and < 24 hours | > 24 hours | > 24 hours; severity based on other criteria | |
| Post Traumatic Amnesia | 0 – 15 minutes | > 15 minutes and < 24 hours | > 24 hours | > 1 day and < 7 days | > 7 days |
| Glascow Coma Scale | 13 - 15 | | | 9 - 12 | < 9 |

Department of Veterans Affairs and Department of Defense. (2009). VA/DOD clinical practice guideline for the management of concussion/mild traumatic brain injury. Retrieved from http://www.healthquality.va.gov/mtbi/concussion_mtbi_full_1_0.pdf.

Exclusions

Mechanisms of Traumatic Brain Injury

No mTBI ($n = 183$)

Blunt mTBI $n = 245$

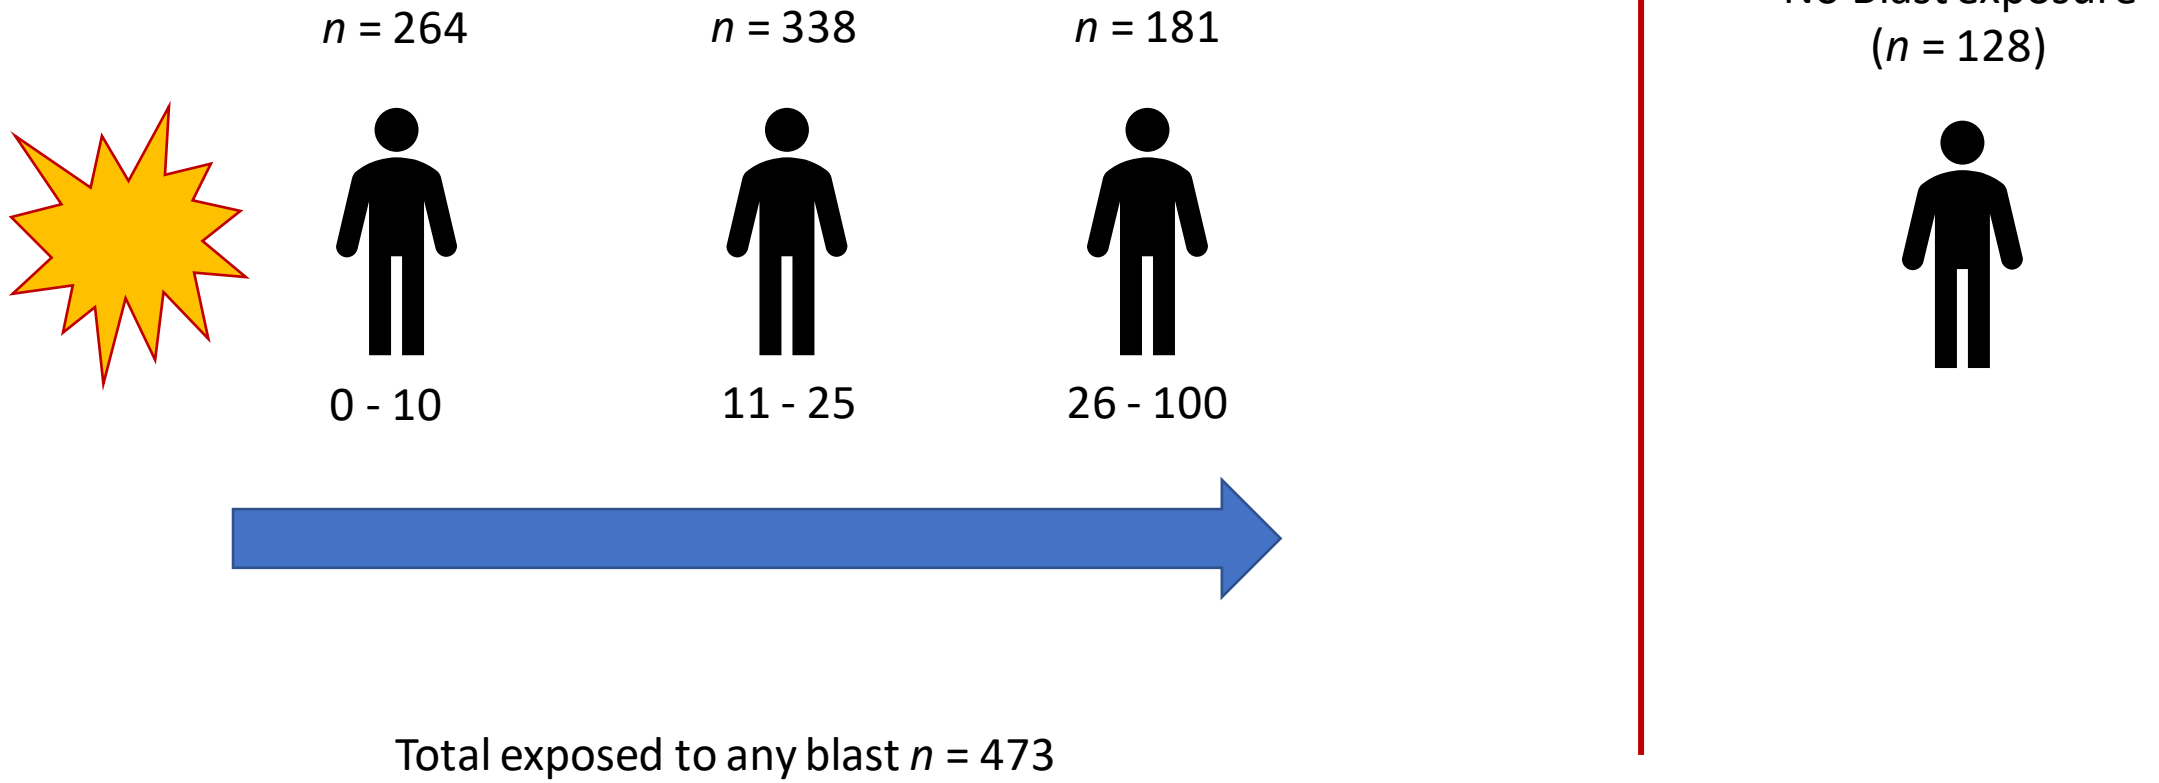

Blast mTBI $n = 173$

Military mTBI $n = 279$

Proximity to Blast

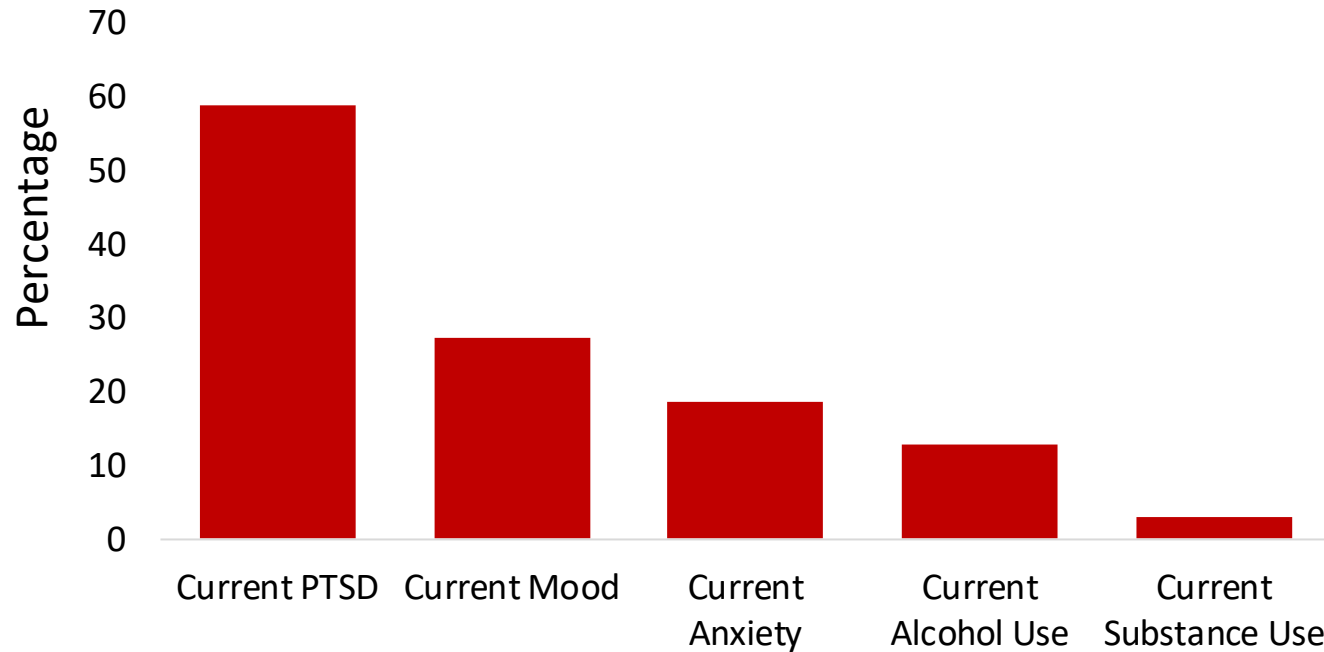

■ Men ■ Women

Demographic Characteristics

Ages ranges from 19-64 ($M = 33.40$, $SD = 9.01$)

Percentage of Participants with Current Diagnosis

Percentage of Participants with a Comorbidity including mTBI

TRACTS Biomarker Innovation

- Large well-characterized longitudinal sample of Veteran men and women.
- Extensive panel of blood-based biomarkers related to brain injury.
- Innovative Quanterix Simoa assay technology.
- Extensive brain imaging data.
- Extensive medical/biological data.

TRACTS Biomarkers Markers

| Biomarker | Type | Function |
|---|--------------|--|
| Tumor Necrosis Factor α (TNFα) | Cytokine | Pro-inflammatory |
| Interleukin 6 (IL-6) | Cytokine | Pro-inflammatory |
| Interleukin 10 (IL-10) | Cytokine | Anti-inflammatory |
| Eotaxin | Chemokine | Coordination of inflammatory cells and allergic inflammation |
| Brain Derived Neurotrophic Factor (BDNF) | Neurotrophin | Neuroprotective |
| Amyloid β 40 (Aβ40) | Peptide | Component of amyloid plaques related to neurodegenerative diseases |
| Amyloid β 42 (Aβ42) | Peptide | Component of amyloid plaques related to neurodegenerative diseases |
| Total Tau & p-Tau181 | Protein | Marker of microtubule damage |
| Neuron Specific Enolase (NSE) | Enzyme | Marker of axonal damage |
| Neurofilament Light (NfL) | Protein | Marker of axonal damage |
| Phosphorylated Neurofilament Heavy (pNF Heavy) | Protein | Marker of axonal and dendritic damage and degeneration |
| Glial Fibrillary Acidic Protein (GFAP) | Protein | Marker of astrocyte damage |

ARTICLE **OPEN**

Plasma biomarkers associated with deployment trauma and its consequences in post-9/11 era veterans: initial findings from the TRACTS longitudinal cohort

Meghan E. Pierce ^{1,2,3}✉, Jasmeet Hayes ^{1,4,5}, Bertrand Russell Huber^{1,3}, Andreas Jeromin⁶, Catherine B. Fortier^{1,2,7}, Jennifer R. Fonda^{1,2,3}, Heather Lasseter^{6,8}, Lauren Chaby^{6,9}, Regina McGlinchey^{1,2,7} and William Milberg^{1,2,7}

Study Aims

Examine blood-based biomarkers related to brain injury and chronic TBI and blast exposure in a polymorbid population of post-9/11 Veterans.

Understand relationships between markers of brain injury and deployment-related comorbidities.

Mechanism of Mild Traumatic Brain Injury

Analyses of covariance (ANCOVA)
controlling for age

Exclusions

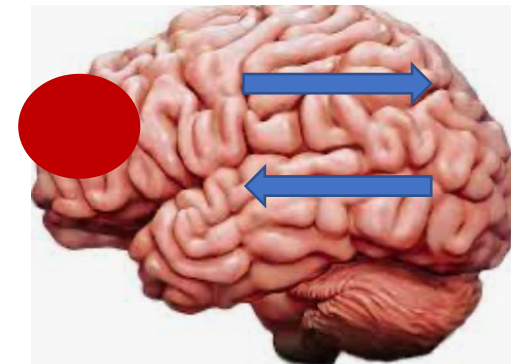

- Cognitive, neuropsychological, psychiatric flags; moderate-severe TBI
- Coefficient of variation (CV) above 20%

Groups examined

- mTBI mechanism of injury
 - No history of mTBI ($n = 183$)
 - Blunt mTBI ($n = 224$)
 - Blast mTBI ($n = 173$)

No mTBI

Blunt mTBI

Blast mTBI

Table 3. Mean level differences in plasma biomarkers related to military mTBI and mechanism of injury.

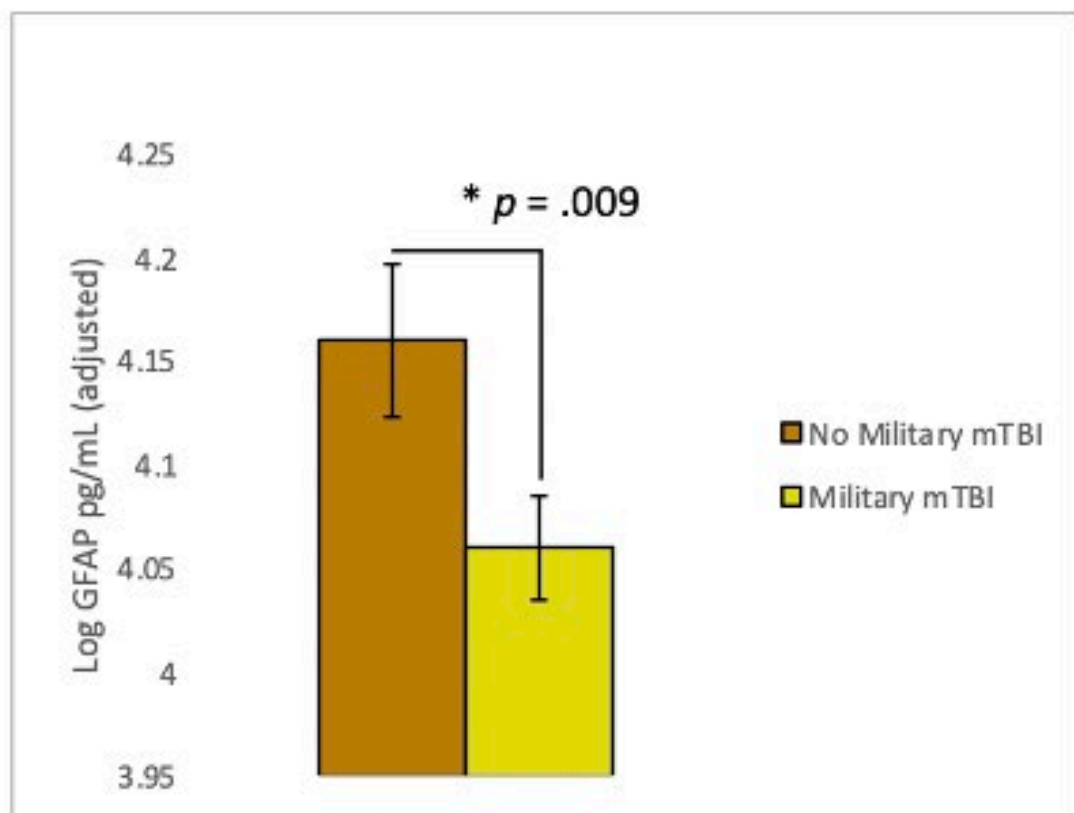

| | Military TBI | | | | Mechanism of TBI | | | | |

Glial Fibrillary Acidic Protein (GFAP)

- Released by Astrocytes
- Reactive Astrogliosis
 - Brain damage & neurodegenerative diseases
 - Stress & inflammation.
- Upregulation of GFAP
 - hallmark of reactive astrogliosis
 - Restores homeostasis after injury/stress/etc.
 - limits tissue damage too
 - If chronic, leads to negative outcomes
 - Can lead to scarring
 - Disruptions in neural communication
 - involved in long term potentiation (LTP)
 - involved in disruptions to neuronal signaling in mice models of Alzheimer's Disease

Military mTBI

Mechanism of mTBI

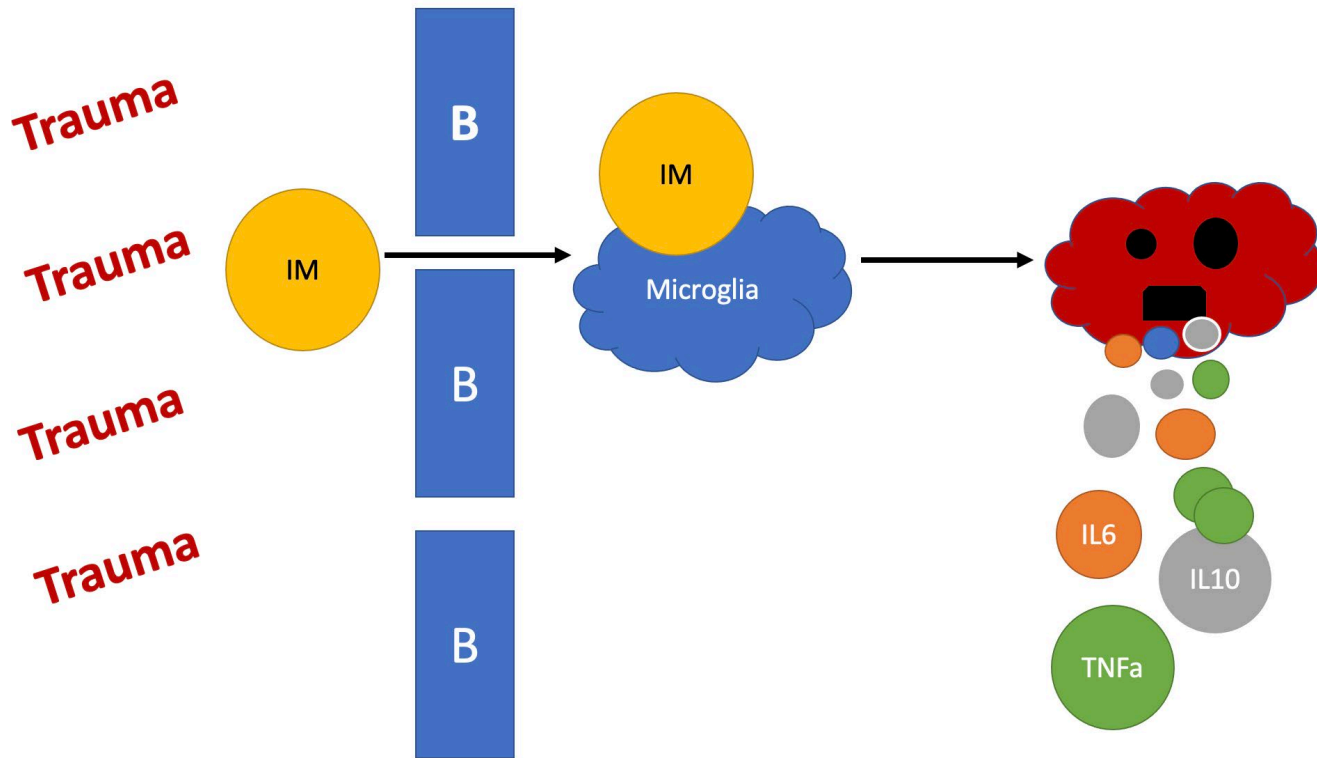

Table 3. Mean level differences in plasma biomarkers related to military mTBI and mechanism of injury.

| | Military TBI | | | | Mechanism of TBI | | | | |

Inflammatory Response to Trauma

- Cytokines modulate inflammation in response to a stressor like trauma and pathogens.
 - Coordination of immune response.
 - Regulate cell growth, proliferation, and differentiation.
 - Chronic inflammation can lead to neural degeneration.

Trend in higher IL6 in individuals with Blast-Related mTBI compared to no mTBI.

Proximity to Blast

Analyses of covariance (ANCOVA)
controlling for age

Exclusions

- Cognitive, neuropsychological, psychiatric flags; moderate-severe TBI
- Coefficient of variation (CV) above 20%

Groups examined

- Blast proximity
 - No history blast exposure ($n = 128$)
 - Blasts between 0-10 meters ($n = 234$)

Note. Partial correlations controlling for age and sex. * < .05; ** < .01, *** < .001. Partial correlation for age was corrected for sex. All significance indicators reflect Benjamini-Hochberg corrected values. BP refers to blood pressure, HDL refers to high-density lipoprotein and LDL refers to low-density lipoprotein.

Conclusions

- Blast, particularly close blast, is associated with chronic alterations in inflammation and glial degeneration.
 - Chronic decreases in GFAP, maybe indicating a downregulation of astrocyte function, is associated with blast-related TBI and close blast.
 - Increased systemic inflammation was associated with close blast, indicating that close blast exposure may lead to Chronic elevations in multiple markers of inflammation.
- Inflammatory markers and GFAP were associated with psychological and health comorbidities.
 - Increased inflammation and decreased GFAP was associated with higher levels of severity in several psychological disorders and metabolic variables.

Study Aims

Inflammation is observed in a wide variety of physiological and psychological conditions.

Given that post-9/11 veterans have a high rate of comorbidities, particularly in our sample, they might be vulnerable to the negative long-term effects of inflammation.

We examined if mTBI or blast exposure moderated the relationships between inflammation and psychological and physical health symptoms.

Transdiagnostic Factors Associated with Deployment Trauma

Previous research from TRACTS utilized factor analysis to create empirically derived clinical components consisting of psychological disorders and mTBI (Lippa et al., 2015; Amick et al., 2018; Esterman et al., 2019).

We sought to expand upon this previous research by including metabolic health symptoms.

We conducted a confirmatory factor analysis to examine model strength using factors of Traumatic Stress, Affective, Somatic, and Metabolic symptoms.

Transdiagnostic Symptom Latent Model

- Good model fit
- CFI = 0.96, TLI = 0.95, SRMR = 0.04, RMSEA = 0.52
- Each latent variable was associated with indicator variables $p < .001$
- Standardized betas ranged from $-.471$ to $.937$

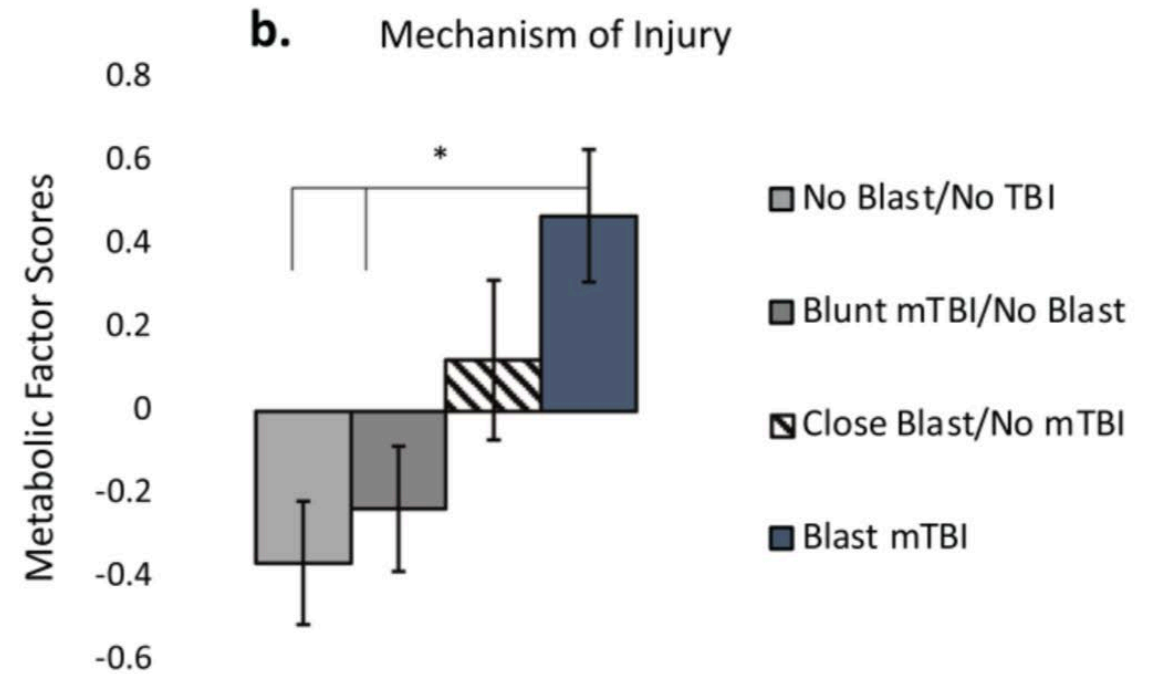

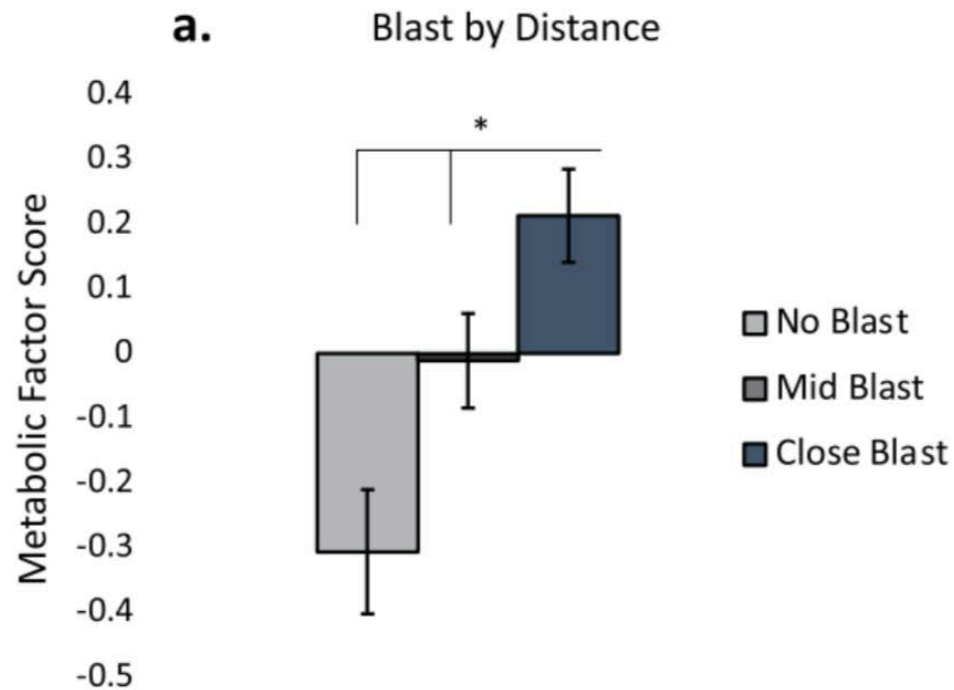

| | Metabolic | | | | | |
|--------------------------------|-----------|---------|---------|--------|---------|---------|
| Step 1: Age | 0.046 | 0.385 | 0.385 | 0.046 | 0.385 | 0.385 |
| Step 2: Metabolic | 0.418 | <0.001* | <0.001* | 0.424 | <0.001* | <0.001* |
| Step 2: Blast/mTBI | 0.016 | 0.747 | 0.747 | -0.065 | 0.185 | 0.613 |
| Step 3: Metabolic × Blast/mTBI | 0.268 | 0.005* | 0.040* | 0.126 | 0.162 | 0.259 |

- There were main effects observed for Traumatic Stress, Affective, Somatic, and Metabolic.
- mTBI did not moderate the relationship between the transdiagnostic factors and inflammation.
- Blast moderated the relationship between Metabolic factor and inflammation.

Metabolic Symptom Severity by Blast and Mechanism of Injury

Conclusions

- The strongest relationship with inflammation was among those exposed to blast and had metabolic dysregulation.
- Blast exposure was associated with metabolic dysregulation in a dose response manner.
- This provides a greater understanding of the health pathways that link blast injury to systemic inflammation.
