(Respect due...)

I. Methods

- Why does qualitative research matter?

How do we build explanations in practice?

How does NPT help us?

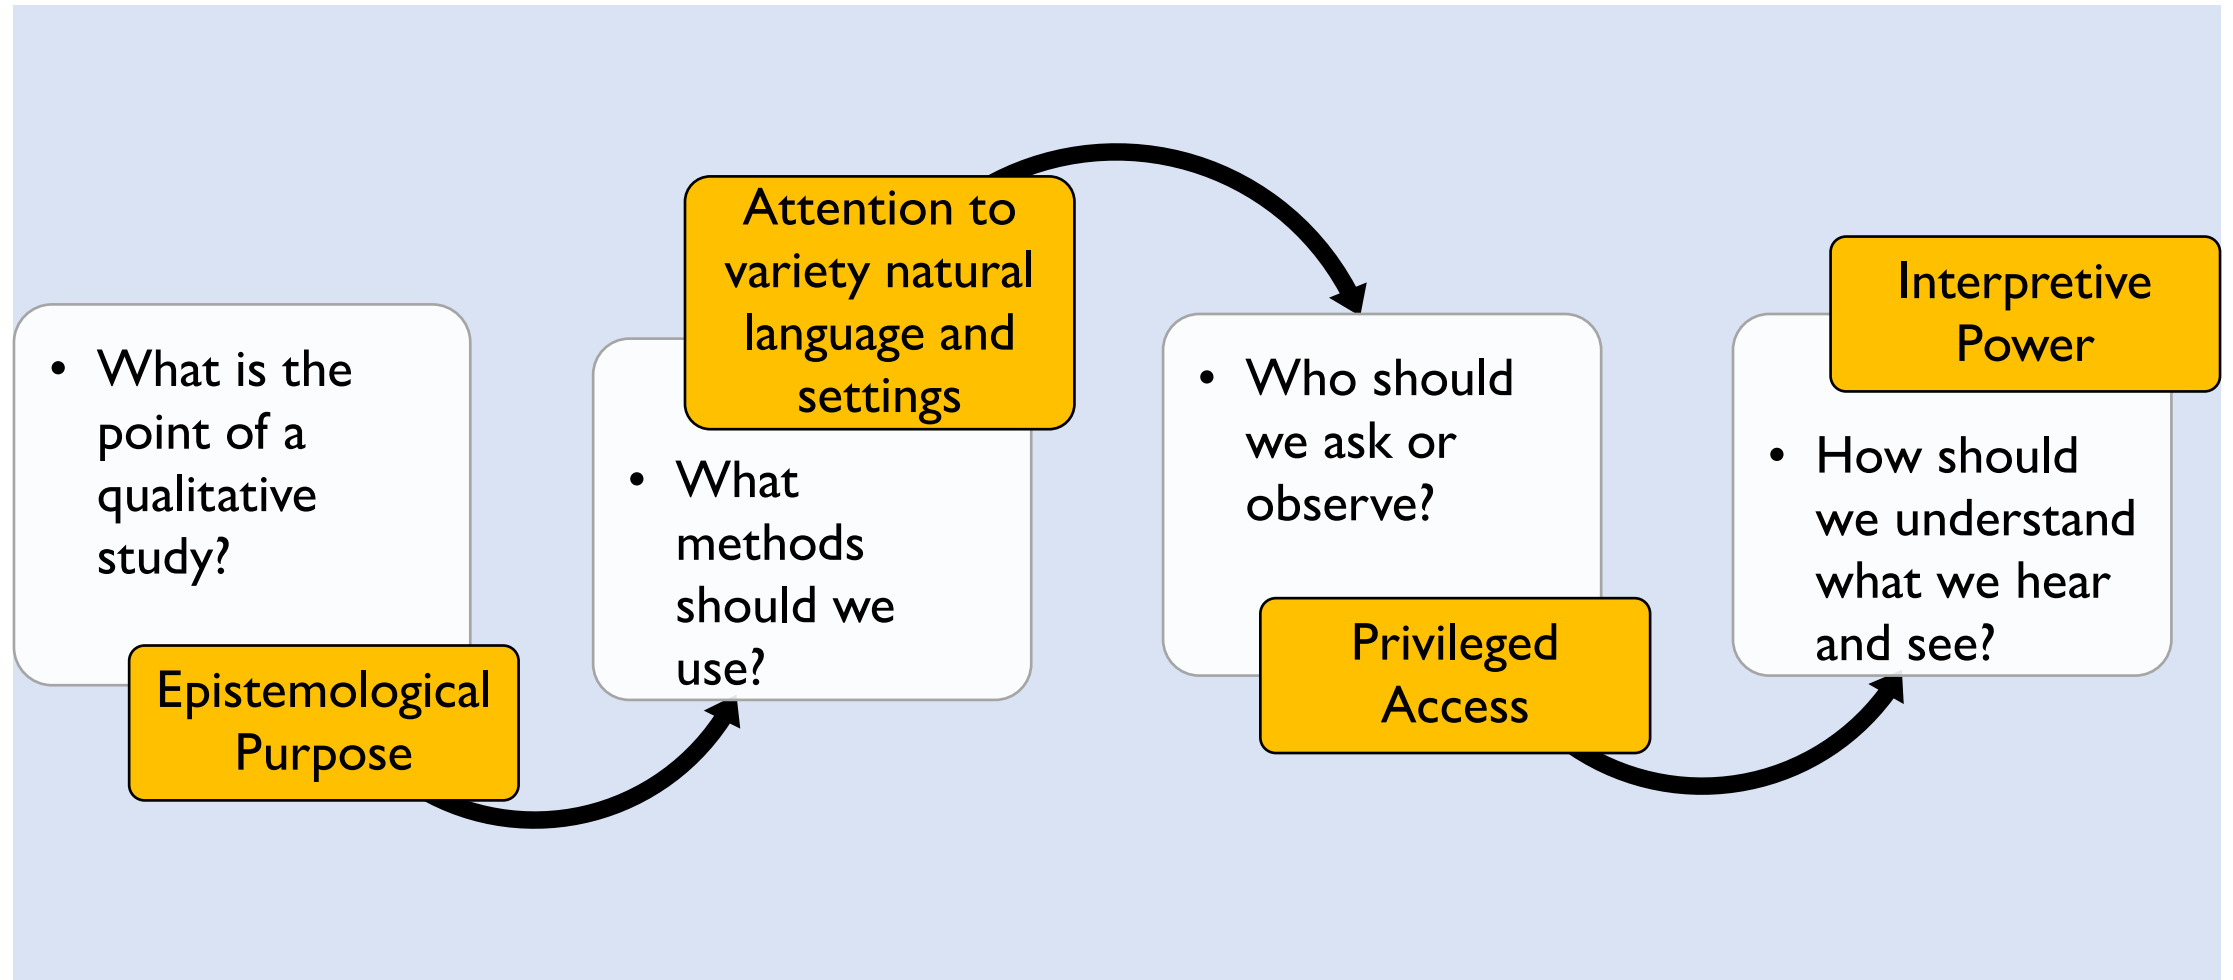

What is Normalization Process Theory?

- What is a coding manual and what does it do?

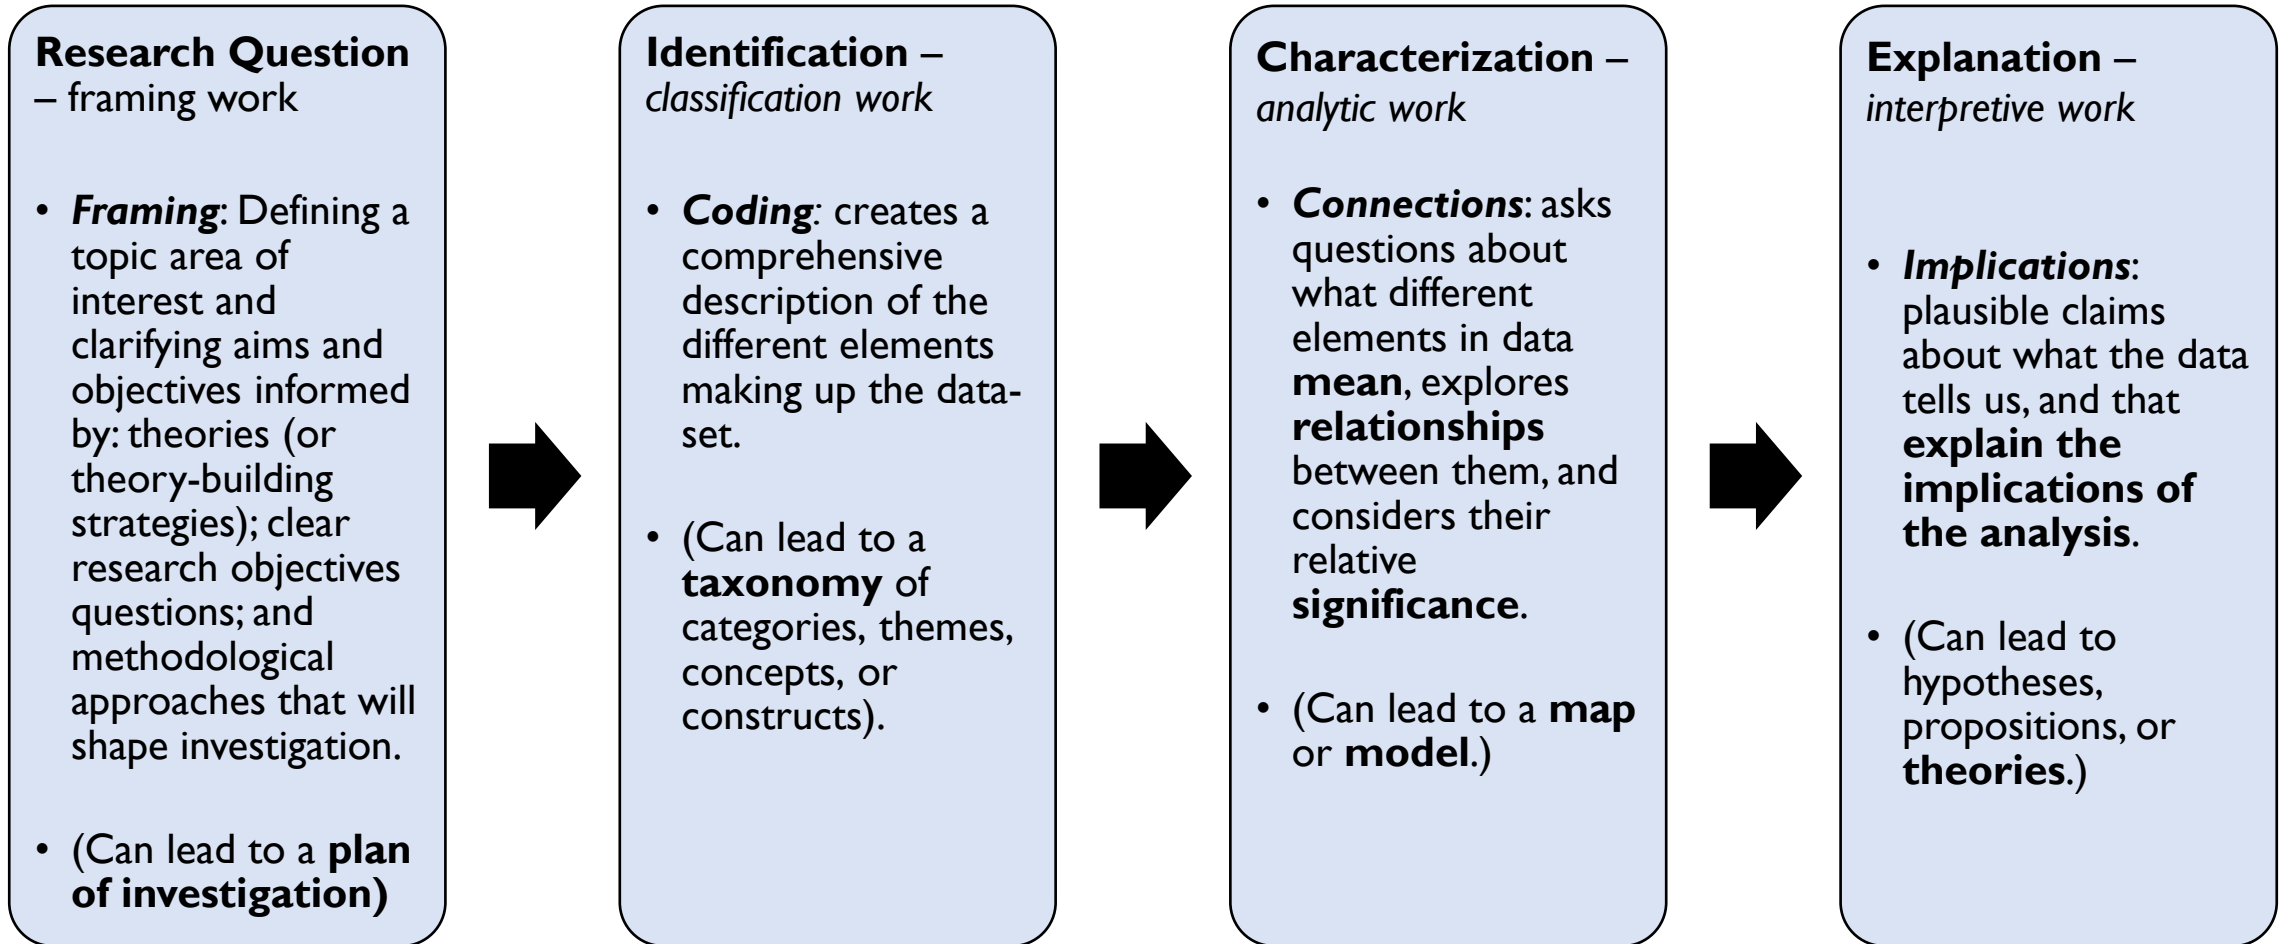

Can we grow interpretive power?

When we do qualitative research, we're most often trying to make sense of what is going on, from the perspectives of the people involved.

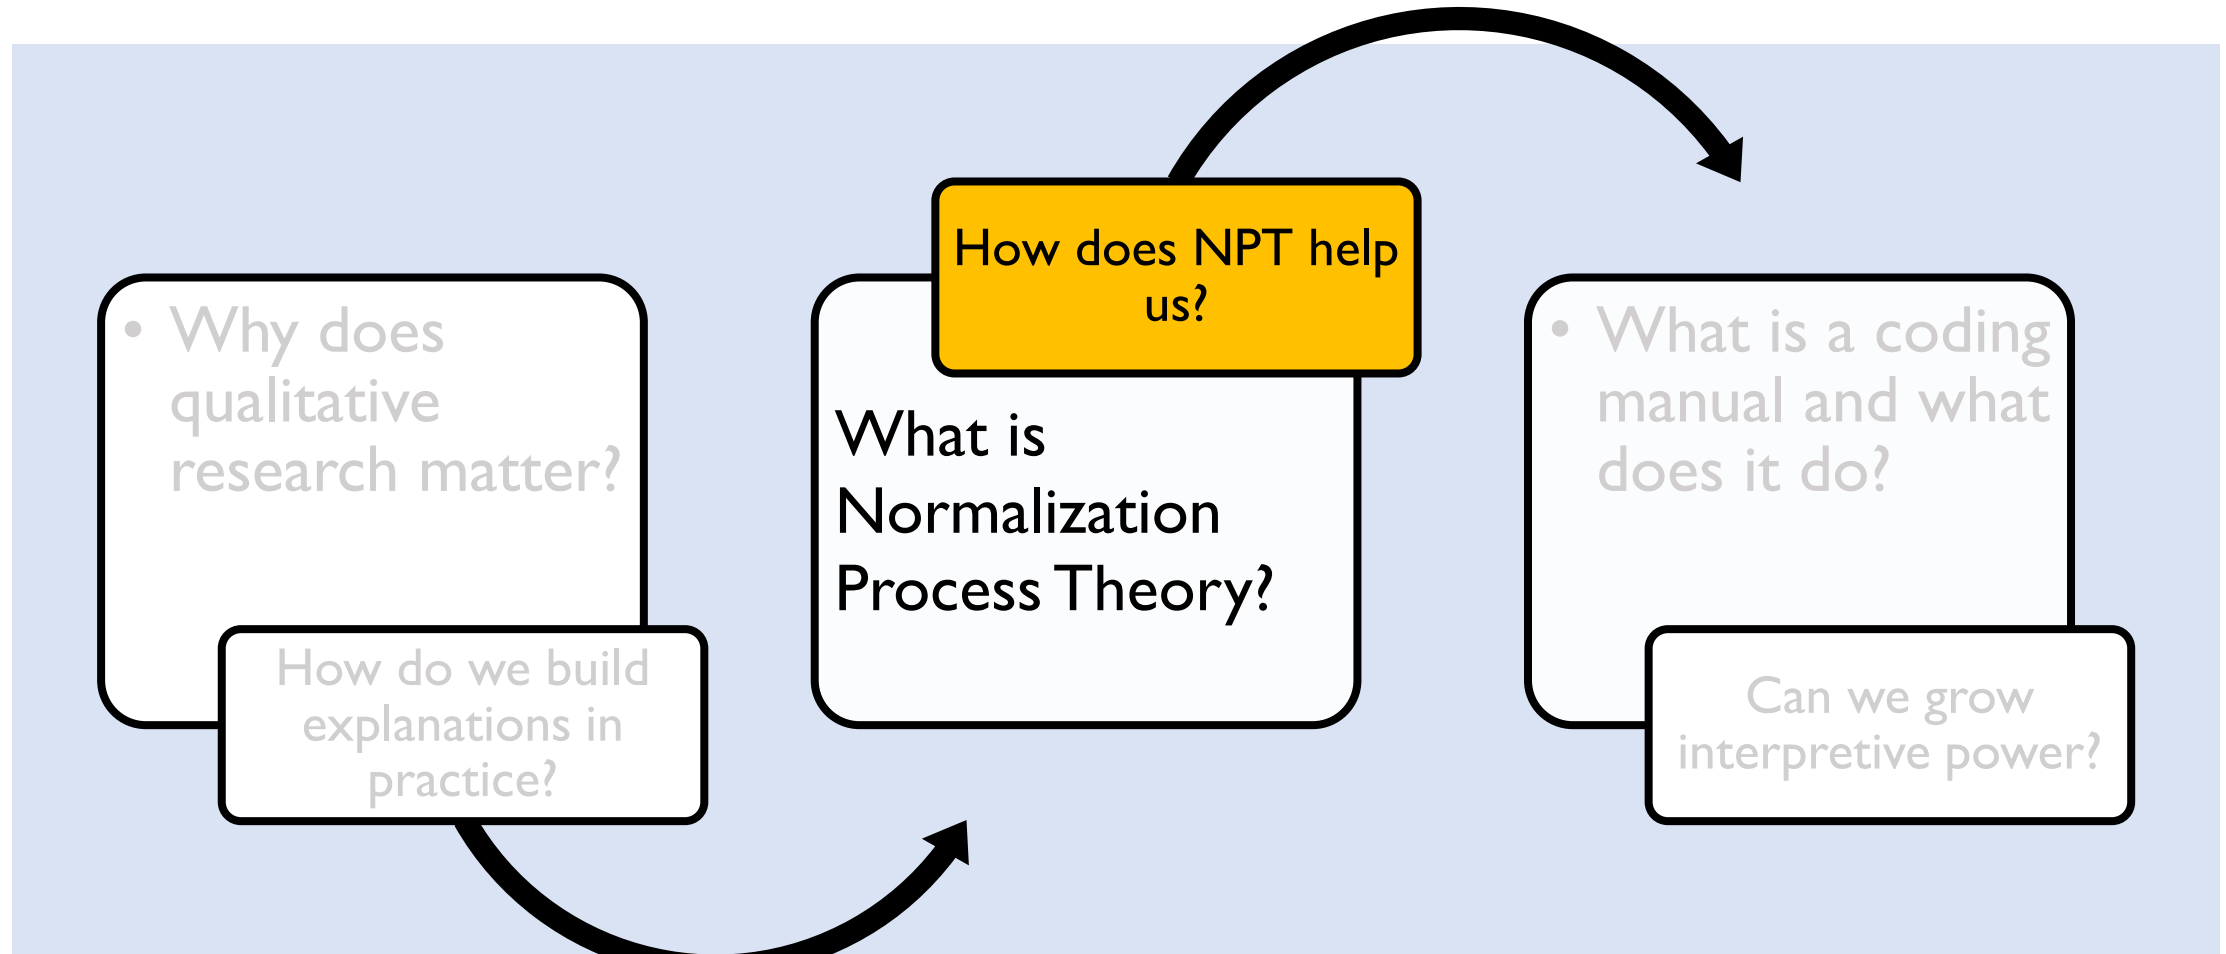

The value of qualitative research

Qualitative work leads to discovery

2. Theory

When we're using theory, we're most often trying to make sense of what is going on, in a way that enables rational and reproducible *explanation*.

Implementation processes and implementation science are not the same

- **Implementation science** is about methods of translation. It involves structured and disciplined activities through which evidence-based interventions are implemented, often in controlled studies.
- **Implementation processes** are non-linear, dynamic, and emergent. They involve complex interactions between intervention components, many different actors, and the contexts. They are often very messy.

In 1998, we needed to understand why it was so difficult for healthcare providers to adopt and operationalize telemedicine systems – existing explanations did not help us

Practical problem: to develop a generalizable framework for understanding the implementation of new treatments and organisational innovations.

Fundamental problem: To better understand the dynamics of human agency under conditions of constraint.

Theory-Building Process: Much more difficult than it seems (twenty years later, still theory-building)

Outcome: Normalization Process Theory – a middle range theory strongly oriented to practice. Now around 800 protocols, empirical reports, theory discussions, and reviews.

What does
Normalization
mean?

NPT is a theory that identifies, characterizes, and explains mechanisms that motivate and shape implementation processes

‘The trouble with telemedicine is that it doesn’t work. The name tells you that. If it worked, it would just be called medicine.’

May, C., T. Rapley, and T. Finch, (2020) Normalization Process Theory, in International Handbook of Implementation Science, P. Nilsen and S. Birken, Editors. Edward Elgar: London.

What is NPT a theory of...?

Implementation is *the translation of the strategic intentions of one group of actors into the everyday practices of others*

The essence of implementation is *collective action and collaborative work*.

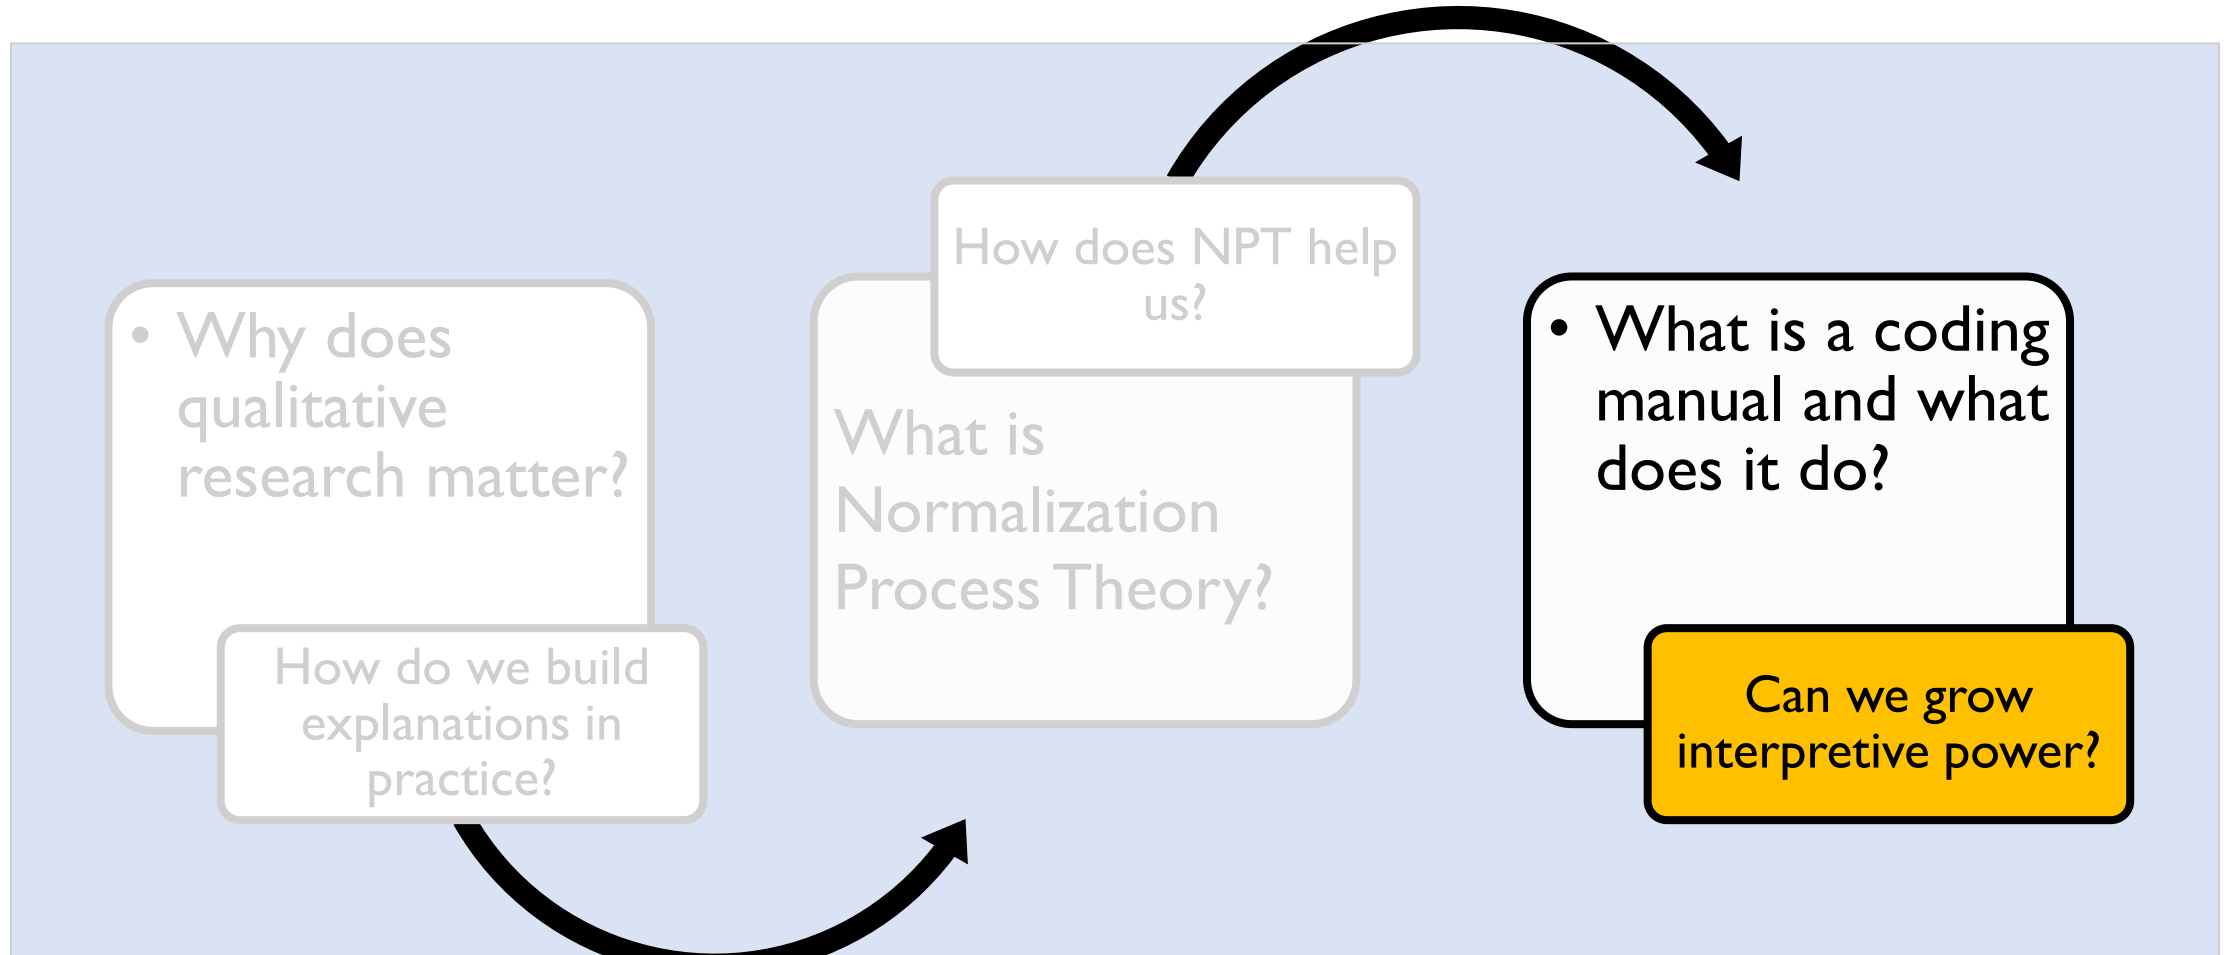

An implementation process is shaped by the collaborative work of participants, as they invest in *continuing translational action*

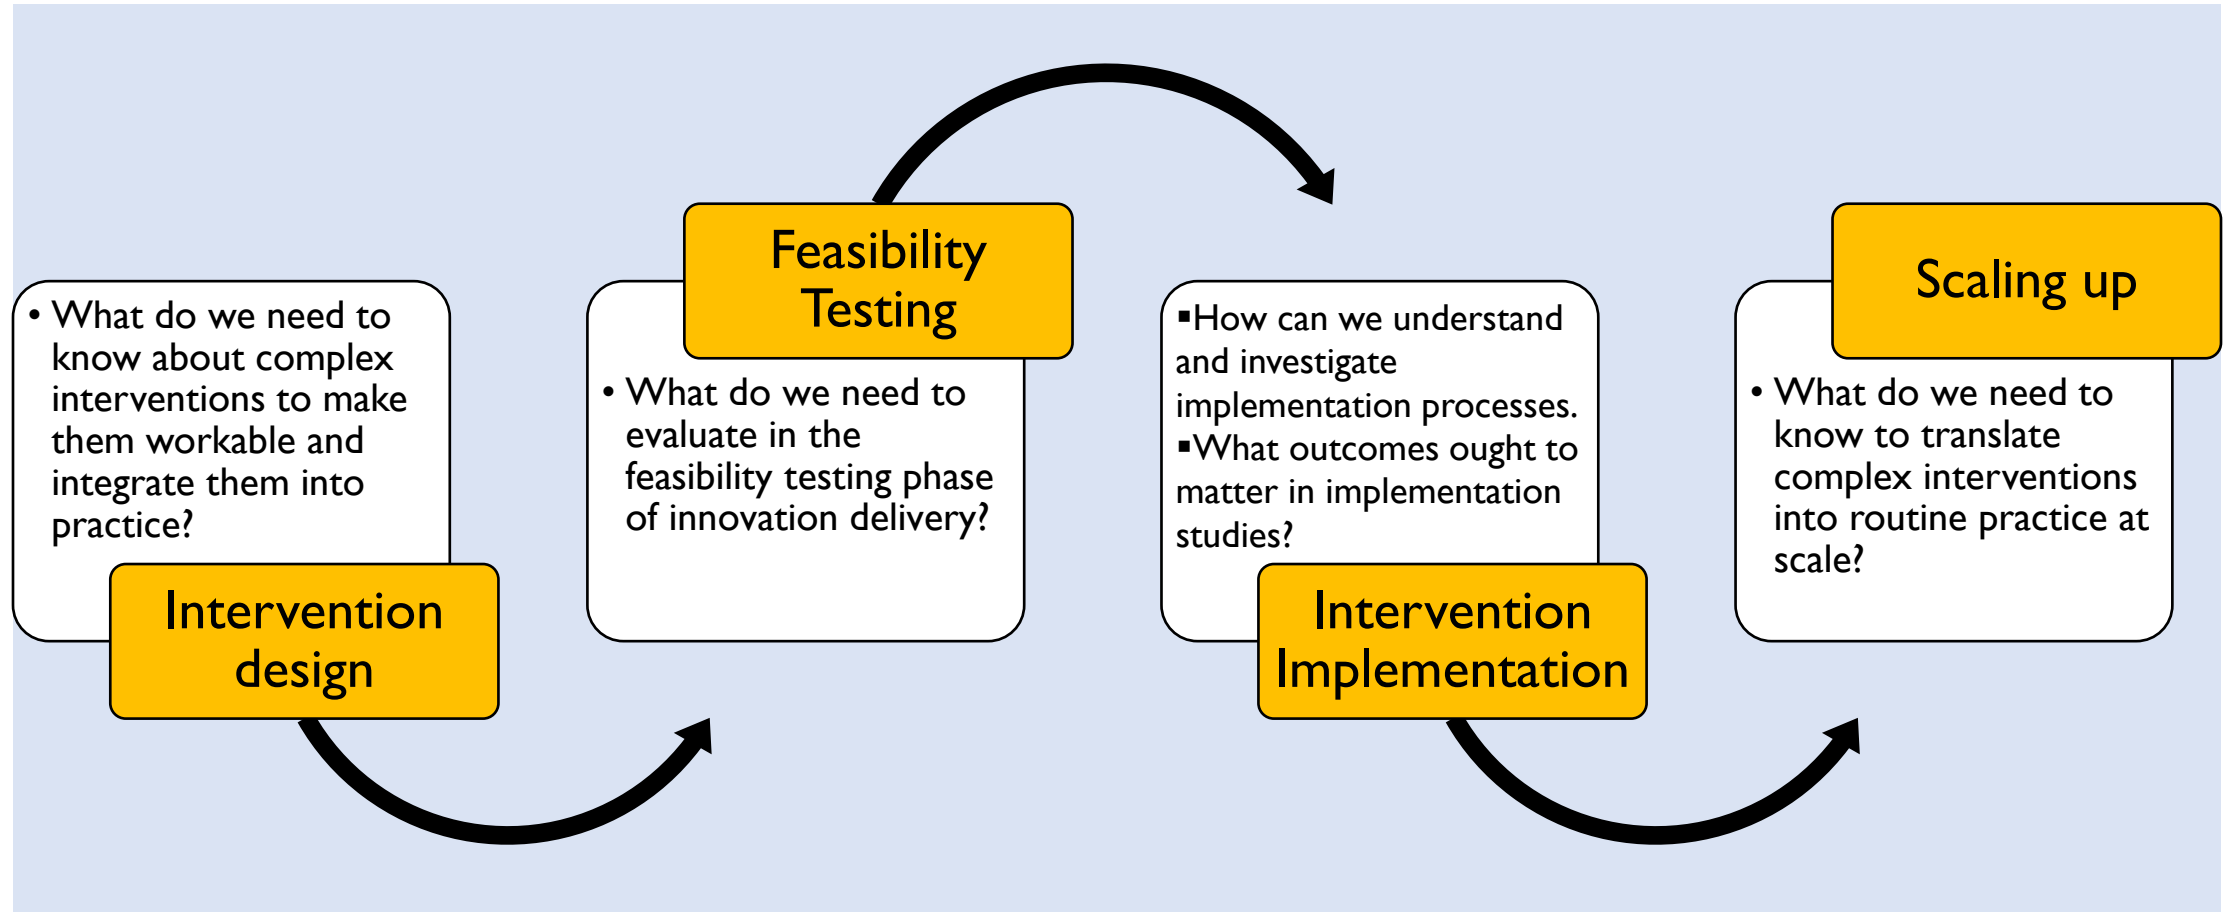

NPT identifies, characterizes, and explains *mechanisms that motivate and shape implementation processes*

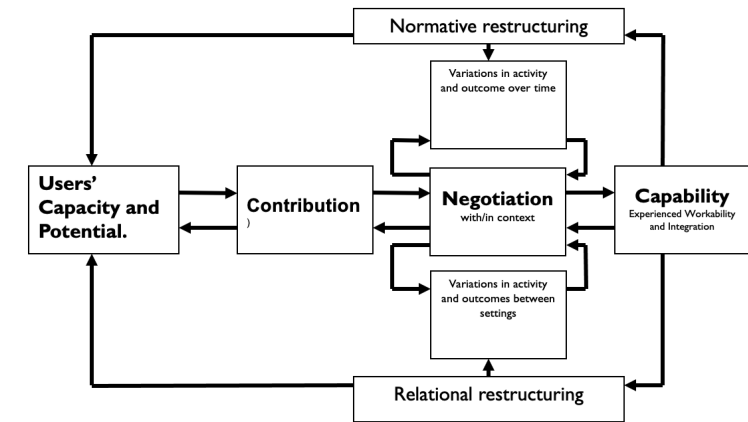

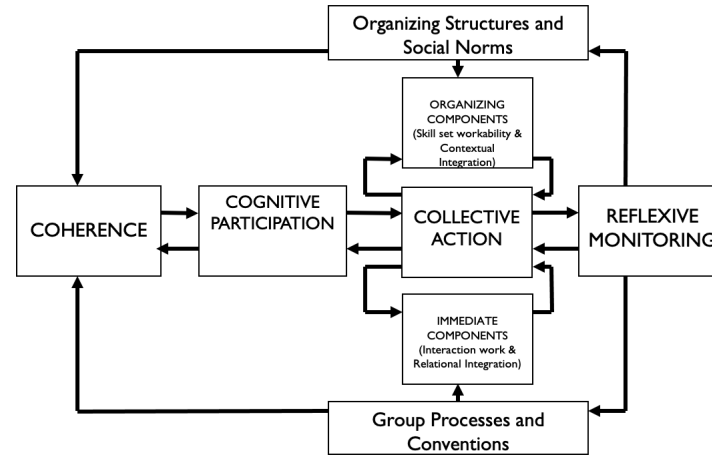

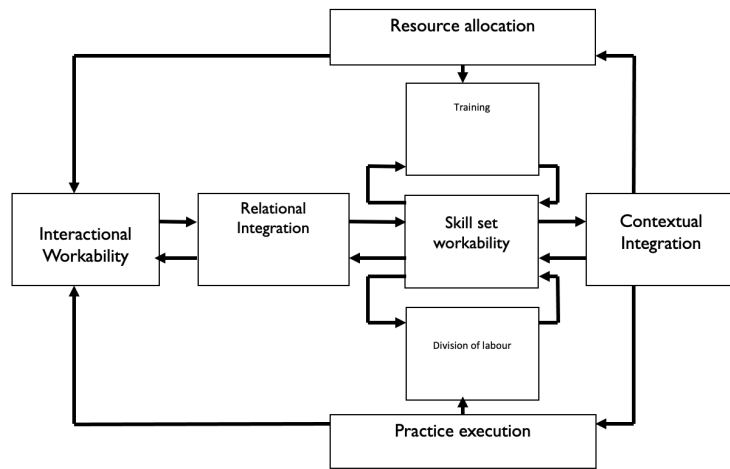

3. Application

NPT offers a useful set of conceptual tools to underpin evaluation and research in the organisation and delivery of care: supporting complex intervention research

NPT focuses on action, but considers this at different levels of analysis – enables us to think through interventions, implementation, and negotiations with contexts

Implementation, context and complexity

Carl R. May^{1,2,3*}, Mark Johnson^{2,4} and Tracy Finch⁵

Abstract
Background: Context is a problem in research on health behaviour change, knowledge translation, practice implementation and health improvement. This is because many intervention and evaluation designs seek to eliminate contextual confounders, when these represent the normal conditions into which interventions must be integrated if they are to be workable in practice.
Discussion: We present an ecological model of the ways that participants in implementation and health improvement processes interact with contexts. The paper addresses the problem of context as it affects processes of implementation, scaling up and diffusion of interventions. We extend our earlier work to develop Normalisation Process Theory and show how these processes involve interactions between mechanisms of resource mobilisation, collective action and negotiations with context. These mechanisms are adaptive. They contribute to self-organisation in complex adaptive systems.
Conclusion: Implementation includes the translational efforts that take healthcare interventions beyond the closed systems of evaluation studies into the open systems of 'real world' contexts. The outcome of these processes depends

Iterations of NPT since 2006 developed 149 identifiable theoretical concepts – we rationalized and simplified these into a workable process model in 2021.

NPT Coding Manual

Not just a coding manual, though. It consolidates & simplifies NPT around a contexts → mechanisms → outcomes way of analyzing implementation processes.

Simplification and recalibration of conceptual structure of the theory: reduced from 149 theoretical concepts to 12 primary constructs & 16 subconstructs.

**Translating
strategic
intentions into
practice space**

Context is troublesome: it goes on forever in every direction.

*When we use NPT, we always start by asking *what the work is?* So, *what's the work of making contexts, and how do they form process ecologies for action?**

Implementation Contexts:

are patterns of social relations and structures that unfold over time and across settings. They make up the implementation environment.

Strategic Intentions:

How contexts shape the formulation and planning of an intervention and its components.

Adaptive Execution:

How contexts affect the ways in which an intervention and its components are made workable in practice.

Negotiated Capacity:

How contexts affect the ways that an intervention and its components are integrated into practice.

Organizational Framing:

How contexts change through enacting an intervention and its components.

***The work that
people need to
do to enact new
practices***

What is the work that people need to do to enact new practices?

When we use NPT, we always start by asking *what the work is? So, what do people need to do to bring a treatment intervention or an organizational innovation into play?*

Implementation mechanisms

Implementation Mechanisms motivate and shape implementation processes and are revealed through purposive social action—**collaborative work**—that involves the investment of personal and group resources to achieve goals

Coherence-building (people work together to understand and plan the activities that need to be accomplished to put intervention components into practice)	Cognitive Participation (people work together to create networks of participation and communities of practice around intervention components)
Collective action (people work collaboratively to enact intervention components)	Reflexive monitoring (people work together to appraise interventions and their components)

**What changes as
a result of all
that
implementation
work?**

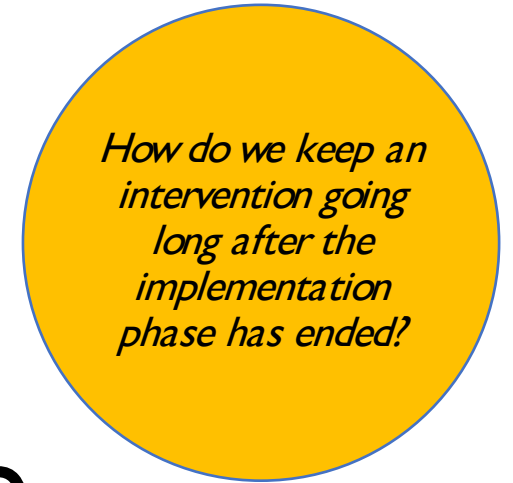

Implementation outcomes are always greater than the sum of their metrics.

*When we use NPT, we always start by asking *what the work is?* So, what is the new work that an intervention or innovation calls for, how does it change the ways that people work with each other?*

Implementation outcomes:

Outcomes are the practical effects of implementation mechanisms at work

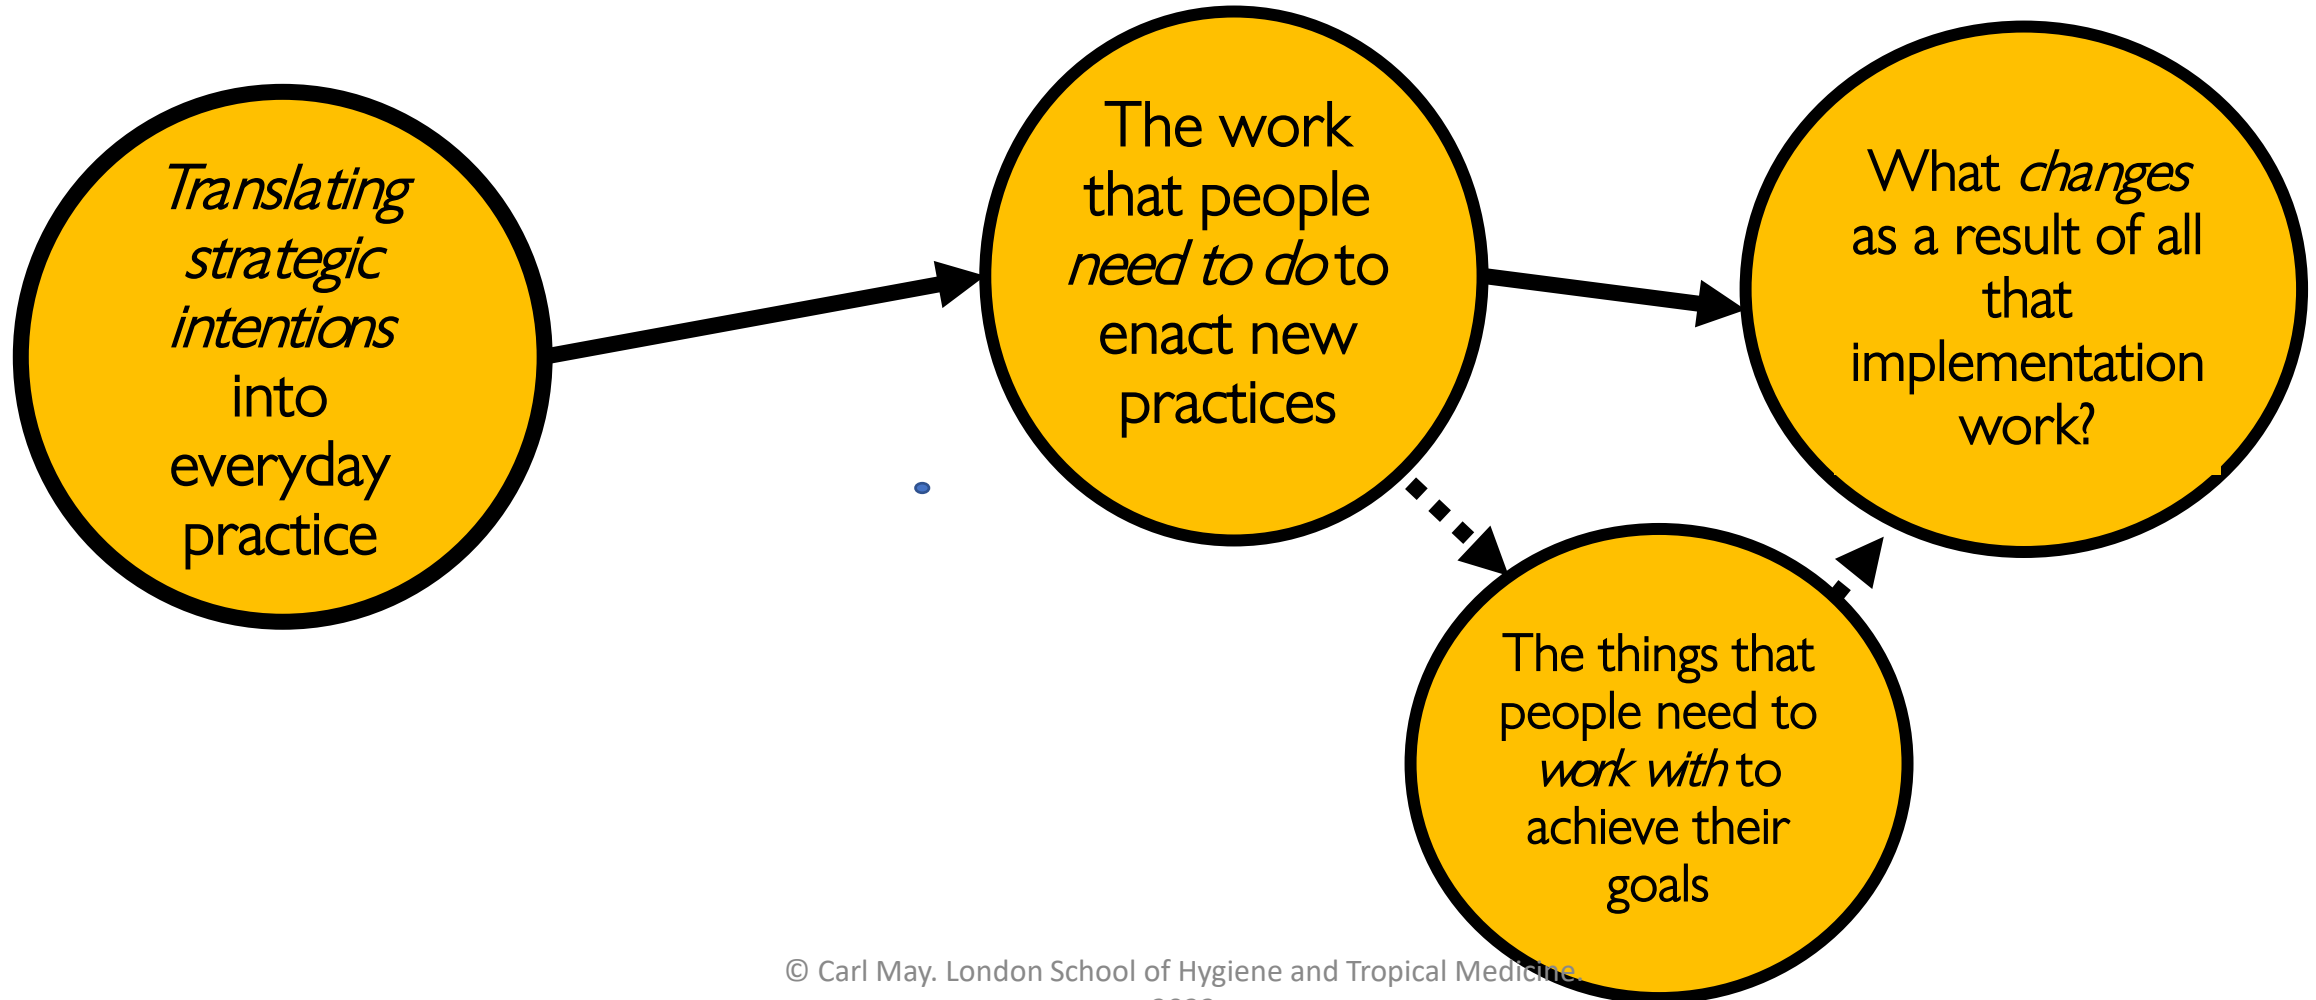

<p>Intervention Performance: How material practices change as the result of interventions and their components being operationalized, enacted, reproduced, over time and across settings.</p>	<p>Relational Restructuring: How working with interventions and their components changes the ways people are organized and relate to each other.</p>
<p>Normative Restructuring: How working with interventions and their components changes the norms, rules and resources that govern action.</p>	<p>Sustainment/ Normalization: How interventions and their components become incorporated/embedded in practice.</p>

Implementation contexts, mechanisms, and outcomes are generative of *continuous translational action*.

When we use NPT, we always start by asking *what the work is? So, what's the work that people need to keep doing to keep an intervention or innovation in play, long after it has been embedded in everyday practice?*

NPT focuses on what is happening *in practice*

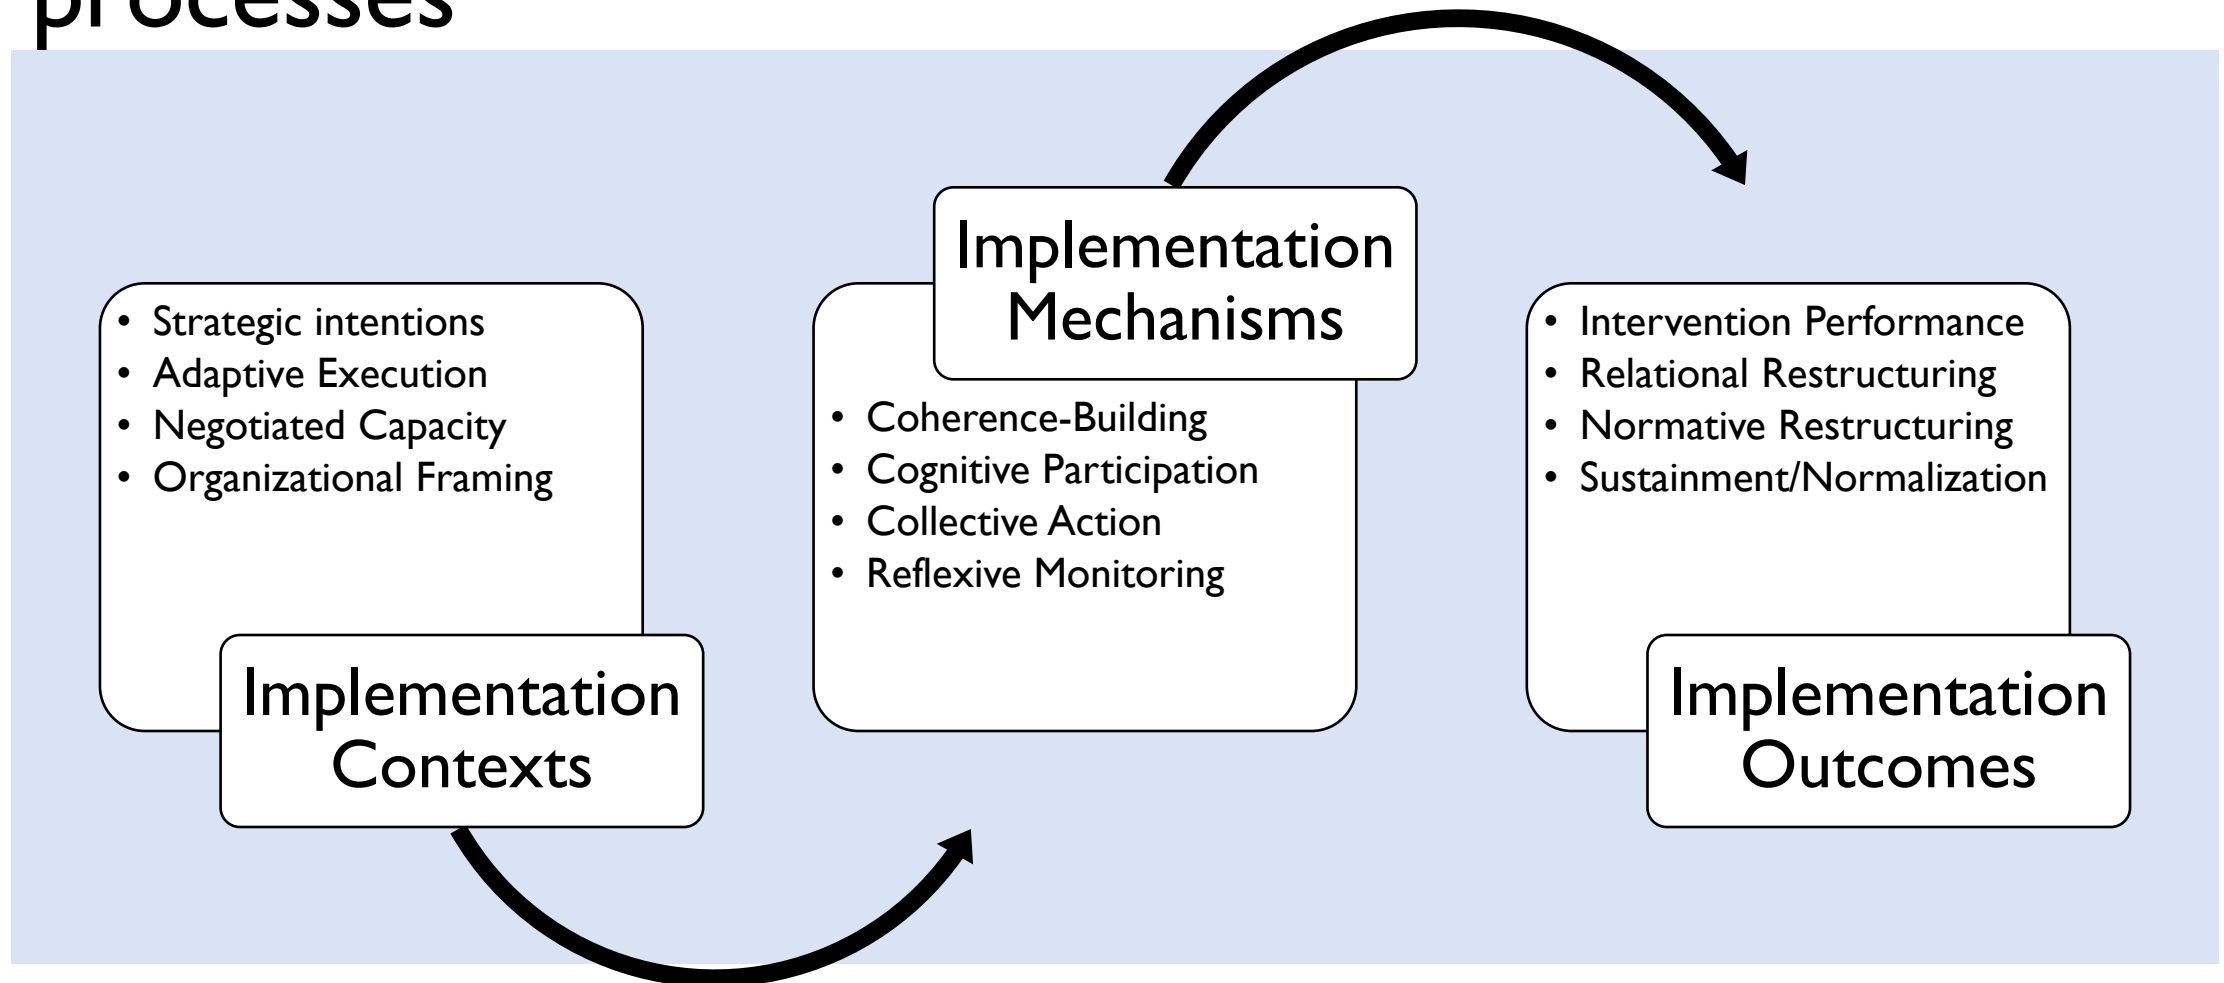

The NPT coding manual is a tool to *assist thinking*

- Not all data will ‘fit’ any particular theory.
- ‘Surprises’ or ‘deviant cases’ are often the most important discovery.
- It is *not* the purpose of a coding framework to verify the underpinning theory.

NPT coding manual clearly describes mechanisms that motivate and shape implementation processes

Theory informed qualitative investigation is useful when it...

Provides a rational (and empirically supported) framework for both evaluation and implementation.

Supports transferability and generalization of interventions in practice.

Explains why, how, and for whom, complex interventions work

Offers robust and rigorously developed strategies for successful implementation
