What does the science say about passion, harmony, and satisfaction at work?

An empirical approach to work-life balance for physicians, academics and other clinical researchers.

A road map

• Is work-life balance a problematic concept? A red-herring?

• How is work-life balance associated with satisfaction at work?

• Key factors and essential ingredients for job satisfaction among early career clinical scientists. . .
  – Mentorship and developmental networks
  – Is gender a factor? (how, when and why?)
  – Creation of intentional scholarly communities
Is work-life balance a problematic concept? A red-herring?

- Dualistic
- Does not incorporate work life into larger identity or vice versa
- Encourages viewing one as taking from the other
- Not an accurate source of job satisfaction
harmonious integration
of work and non-work identity as an alternative Conceptualization?

• Healthy integration of work identity into home life and vice versa

• Joy, pleasure, achievement, value are found in both arenas

• Recognition that one feeds & informs the other

• Identity is bigger than work, profession, status, title, family role, gender and parental status
Is work-life balance associated with satisfaction at work?

**Yes**

- Satisfaction at work and positive perception (valence) of work-life balance are linked.

- Some general factors associated with work environment/climate that influence satisfaction & perceptions of work-life balance
  - Autonomy
  - Flexibility
  - Stress-in-Work-Environment
  - Climate

**No**

- Variability in valence of perception of work-life balance among individuals in similar or same field, similar or same schedule, similar or same extra work factors (e.g., family)

- Important (under recognized) role of intra-individual characteristics—PASSION— that play into “fit” between person and work environment.

(No vs. Yes, but...)
Obsessive Passion

Key Characteristics

• Strong engagement in activity

• Engagement is perceived as non-voluntary-
  – Either chosen for you
  – Disengagement not permissable or autonomously regulated

• Internalized into identity via “contingencies”

• Disengagement is “dangerous,” perceived to “threaten” the integrity of the passion or one’s identity

Link to Satisfaction

• Non-voluntary engagement and diminished sense of autonomy are linked with dissatisfaction and negative perceptions of balance.

• Inhibits or incompatible with autotelic or “flow” experiences, which mediate the relationship between work engagement and satisfaction.

• Inhibits harmonious integration of work and life because one is perceived to detract from the other
  – disengagement from work will bring punishment
  – work is “work”
Poll question # 1

How often do you find yourself worrying that not engaging in work—when you are away from work—is going to come with “consequences?”

1. Never
2. Rarely
3. Sometimes
4. Often (1+ times per week)
5. All the time
## Harmonious Passion

### Key Characteristics

- Strong engagement in activity
- Engagement is voluntary, autonomously internalized into identity (free of identity linked contingencies)
- Part of identity that was freely chosen and remains under one’s control
- Disengagement and re-engagement are easy, disengagement does not “threaten” the integrity of the passion or one’s identity

### Link to Satisfaction

- Voluntary engagement and sense of autonomy are linked with satisfaction and positive perceptions of balance.
- Promotes autotelic or “flow” experiences, which mediate the relationship between work engagement and satisfaction.
- Allow for harmonious integration of work and life both because
  - disengagement from both are permissible and not “dangerous”
  - because work is not “work”
Poll question # 2

How often do you find that you experience “flow”, -the joyful immersion in your work or experience of “being in the zone”-- such that it doesn’t feel like work?

1. Never
2. Rarely
3. Sometimes
4. Often (1+ times per week)
5. All the time
Cultivating Harmonious Passion

- **Making Sure your priorities are your own**
  - Taking enough time/responsibility to identify your priorities?
  - Identifying “false trails” that may cloud/confound your decisions.

- **Surrounding yourself with individuals who are well-aligned with your priorities**
  - Selecting friends and social networks that “get it”
  - Creating a developmental network or an intentional scholarly community that fosters your passion and supports harmonious integration of life and work.
MENTORSHIP, Gender, AND EARLY CAREER SATISFACTION

- Mentorship and professional networks are crucial to job satisfaction and success for early career academics, including those in medicine and the allied health professions.

- Common complaints among early career researchers include scarcity of “ideal” role models/mentors and few conversations about life-work harmony initiated by mentors.
  - These complaints are more prevalent among women.
  - Female gender is associated with greater risk of early career departure and lower job satisfaction in academic medicine.
  - Female gender is associated with greater likelihood of negative appraisal of work-life balance or the perception that “harmony” is not possible.
Unpacking the gender based discrepancy in job satisfaction

• Real world challenges
  – Discriminatory practices/policies.
  – Old-school views of women in the workplace.
  – Child care and family responsibilities.

• Internalization of gendered roles/expectations
  – A pathway to obsessive passion?
  – “Not okay” to disengage from work- particularly for gendered reasons (i.e., child related care).

• Unreasonable/unfair expectations of female mentors?
Developmental networks – Moving Beyond the Mentor-Mentee Dyad

• Recommendation—move to creating developmental networks

• Developmental networks help us
  – Achieve our professional goals and nurture us personally
  – Prevent placement of inappropriate expectations of individual mentors
  – Encourage multiple perspectives which can foster autonomy and growth

• Developmental networks are dynamic and relationships should change over time
Creating intentional scholarly communities

- Deliberate and intentional selection of individuals who help to foster your passion
  - Similar content areas
  - Complimentary expertise
  - Willingness (safety) to provide honest appraisal and to “tell the truth”

- Cultivation of relationships that offer models of harmonious passion and healthy integration of work/life

- Awareness of dynamic and fluid nature of scholarly communities and relationships can ebb and flow as work load, personal life and scholarly needs change with time – moving away from a one-size-fits all or “wonder mentor” concept

- Awareness of need (and willingness) for separation from relationships that are incompatible with your needs and goals
  - Peers/colleagues/mentors who foster beliefs/goals/passion incongruent with your own
  - Poor integration of work and life
  - Difficult to “disengage”
  - Avoiding the “jerk at work” phenomenon
  - The “dark side” of mentoring
Call to action

• Identify your passion, core goals, values and beliefs and align them with your work
• Be your own empiricist. Self-assess—how are you doing?
• Create intentional scholarly communities (networks with many mentors) that foster this passion.

• Mentor up – look for opportunities to model those areas others may seek and be open to finding models in junior colleagues.

• Model harmonious engagement in your own passion - -because others are watching you.

• Pay it forward – offer to mentor or guide those who are challenged in areas you once were.

• Why? It improves academic productivity and personal life. It feels good.

Gender

The fallacy of chasing after work-life balance

“There is no such thing as work-life balance. Everything worth fighting for unbalances your life.”
— Alain de Botton

As a pediatric intensivist and clinician-scientist, finding a balance between work and life is essential to my professional success and my personal happiness. Failure to achieve a healthy balance will result in burn-out. So I was warned all these years since the first day of medical school. In 2013, 180 articles documented that physicians are highly dissatisfied with their jobs. This is a testament to how poorly we are balancing work and life (1–4). Interestingly, to my best knowledge, to date only 12 articles have been published specifically addressing work-life balance in Pediatrics (5–16).

Since entering medical school over two decades ago, I reached the conclusion that the concept of work-life balance acts as a quicksand in our professional and personal lives resulting in slow drowning in frustration, depression, and exhaustion. The harder we fight the deeper and quicker we sink. Why are we taught to strive for work-life balance in the first place? The entire future of our modern “24/7” society appears to revolve around mastering this concept, with the ultimate promise that — once achieved — we will all be composed of responsibilities assigned to a physician once out-of-training actually accentuates rather than diminishes our daily stress level and results in further spillover of work-time into leisure-time.

As we follow our peers’ instructions trying to balance work and life, the question arises: when should we achieve this balance and How do we know we achieved it? Since most of us enter the workforce as teenagers, would our high school or medical school years be a good time to start embracing this concept? Our early professional career years? At mid-career level? After retirement? While common sense tells us that the pursuit of work-life balance should occur during all stages of our careers, we all have a tendency to constantly postpone any significant improvement in our daily quality of life until after the current project is completed, after this service week, after the next promotion, after the kids are out of the house. Just how poorly we balance our work and life throughout our careers was highlighted in a recent study showing that early career physicians had the lowest satisfaction rate with their overall career choice, and mid-career physicians reported the lowest satisfaction rate with their specialty choice and their work-life balance (24). Alarming, similar job dissatisfaction rates have been reported for medical students and interns (25). Particularly, the high institutional demands for the new generation of clinician-scientists, which are deeply rooted in our professional culture, add further barriers to a healthy work-life balance (26). Clinician-scientists face additional challenges dealing not only with the separation between work and life but also between clinical care and research. A key reason for early career physicians to leave academic medicine is in fact the disconnection between their own priorities and those of the dominant culture of academic medicine (27). It is obvious that as physicians we are facing tremendous struggles throughout all career stages in implementing what would
seem the natural number one priority for our health and happiness, a balanced life-style.

Personally, I concluded that the never-ending chase after work-life balance actually accumulates much more frustration than satisfaction. Regardless of this depressing conclusion, we may not at all be doomed if the true payoff reveals itself not in the chase but in the achievement of work-life balance. This leads me to the second question: how would we know that we achieved it? Exactly how much life do we need to balance our work? Will we just wake up one day and feel "balanced"? Unfortunately, the absence of an objective outcome measure makes the chances of ever achieving this goal rather elusive. As the movers and shakers of our industrialized nations continue to promote the work-life balance concept as the Holy Grail of the twenty-first century go-getter mentality, engraining into our minds that a more balanced and happier life lies just around the corner, I cannot help but getting reminded of the entrance gate at Auschwitz displaying "Arbeit Macht Frei" (Work Will Liberate You). The pursuit of a concept that is intangible and lacks validation is unlikely to result in anything but a sense of failure and helplessness, or what most of us know as "burn-out".

Twenty-four years after entering medical school, after uncountable reminders by my peers at each step of my career that this right now is actually the best time of my life, lecture after lecture from medical school through residency and fellowship all the way to today’s Faculty Development Program in my Department, I am reminded that without finding that magical work-life balance I cannot, and will not, succeed in this stressful and demanding profession (28, 29). Instead, over the past two decades, I realized that regardless of the number of programs our society develops to promote the concept of a healthy work-life balance it is an indisputable fact that certain career pathways, including modern academic medicine, are inherently incompatible with spending the majority of our time with our families and children, or engaging in certain hobbies such as traveling the world.

All that being said, over the past few years I have adapted a new approach to a healthier and happier life-style that resulted in much greater job satisfaction. While the medical education system has never offered me an alternative solution to living a fulfilled life except the pursuit of work-life balance, I have come to the conclusion that as long as there is a polarity in our daily lives between what we consider work and what we consider life there will always be conflict. Only the abolition of this dichotomy will establish harmony in our lives. Once I was able to integrate rather than separate all my daily activities, harmonize rather than divide my time not only between work and life but also between clinical care and research, the pursuit of balance shifted from work-life to life-nature-universe. The result was an overwhelming daily feeling of "balance." Buddenberg-Fischer recognized in 2008 that "a well-balanced integration (not separation) of professional and private life is an essential goal for the new generation of doctors" (30).

The constant pursuit of work-life balance actually worsens rather than improves our quality of life by adding additional, often unrealistic, expectations to our already stressful lives. Uncountable websites and publications promote quick fixes for the "unbalanced" health care worker (31–33). The question remains: can a successful clinician-scientist really eat six small meals a day? Work-out four times a week? Attend all family functions? Spend regular quality time with friends? The root of the problem lies in the fundamental assumption that life is good and work is bad, which is the main reason why we need a work-life balance in the first place. This distinction also implies that life only occurs whenever we are not at work, demoting the importance of work in our lives and projecting unrealistic expectations onto our time-off-work. The feeling that work is externally imposed onto us causes resentment against this activity and victimizes us as employees implying that we are forced to work against our free will. It is a fact that we spend more time at work than with our partners, our families, or in bed. Therefore, to label the majority of our time as unwanted and burdensome translates into increasing exhaustion and frustration at the workplace. This creates enormous pressure on our leisure-time to compensate for all the negative energy that accumulates at work. In return, the inability to accomplish all the regenerating goals, we had set for today results in further desperation and inevitable failure.

All humans have an intrinsic desire to create, to build, and to leave a mark and an impression, as a matter of fact to work. As humans, we have always searched the contact with other humans. We have a desire to share our experiences, creations, and achievements with others. If we consider our time at work as just that, as time with colleagues and friends that allows us to create, to build, and to leave a mark and an impression, then suddenly life has taken over work, and the pursuit of a work-life balance becomes an obsolete concept. Our happiness may in fact have nothing to do with finding balance but much rather, as John Irving writes, with finding a way of life we love and having the courage to live it.

If as physicians we stand behind the personal statements we wrote as medical students and our eloquent speeches during job interviews describing that special day we realized we were destined to become a doctor and care for sick children, then we all clearly chose this profession out of free will. If that premise holds true, then the hours spent treating sick children are part of our lives just as much as the hours sipping on a glass of wine, going on a family vacation, or fishing with our buddies. Suddenly, the border between life and work vanished, work became life, and life became work. We all have some better and some worse days, but as physicians by the end of each day we will have made a difference in at least one child’s life. If at that moment, we pause for a second acknowledging this incredible achievement, recognizing that we made this world a better place for somebody today, we will experience the indescribable privilege of feeling balanced every day.

Two children died last night during my call in the ICU. One family saved the lives of four children by donating their son’s organs. The other family told my team what an honor it was for them to meet us and they will never forget how we helped them cope with the tragic death of their 12-year-old daughter. I am tired, exhausted, and hungry. But right now, I am balanced.

ACKNOWLEDGMENTS
Special thanks to Dr. Sunny Anand for his never-ending support and to Dr. Jessica A. Liebman for a “feisty” but very productive discussion.
