Delivering Home-Based Cardiac Rehabilitation to Veterans

Mary Whooley, MD, FACP, FAHA, FACC
Principal Investigator, Measurement Science QUERI
Director of Cardiac Rehabilitation, San Francisco VA
Professor of Medicine, Epidemiology and Biostatistics
University of California, San Francisco

May 10, 2016
Audience Poll Question 1 (please respond)

Which statement best describes your facility?

• Offers traditional (but not home-based) cardiac rehab
• Offers home-based (but not traditional) cardiac rehab
• Offers both traditional and home-based cardiac rehab
• Does not offer or refer Veterans to cardiac rehab
• Refers all eligible Veterans to non-VA (fee basis) cardiac rehab
• None of the above (or don’t know)
Audience Poll Question 2 (please respond)

What is your primary role as it relates to cardiac rehab?

– I am a VA provider already delivering home-based CR
– I am a VA provider interested in delivering home-based CR
– I am a VA investigator
– I am a VA healthcare trainee
– I am a VA patient
– None of the above
Home-Based Cardiac Rehabilitation

- Rationale for cardiac rehabilitation
- Evidence for home-based delivery
- Example programs
- Implementation in VHA
After a heart attack, stent placement, or bypass surgery, patients feel highly motivated to make lifestyle changes.

This is a huge opportunity to improve health and longevity.
Patients Who Should be Referred to Cardiac Rehab:

All patients hospitalized for:

- Acute myocardial infarction  
  - Class I Recommendation  
  - Level of Evidence A
- Chronic stable angina
- Coronary artery bypass grafting
- Percutaneous coronary intervention
- Cardiac valve surgery
- Cardiac transplantation

*Thomas et al, Circulation 2007*  
*Thomas et al, Circulation 2010*  
*Drozda et al, Circulation 2011*
CMS Physician Quality Reporting System (PQRS)
Measure #243 (=National Quality Forum #0643)

“Cardiac Rehab Patient Referral from an Outpatient Setting”

Percentage of patients evaluated in an outpatient setting (who within the previous 12 months have experienced an acute MI, CABG surgery, a PCI, cardiac valve surgery, or cardiac transplantation, or who have chronic stable angina and have not already participated in an early outpatient cardiac rehabilitation/secondary prevention program for the qualifying event/diagnosis) who were referred to a CR program.

Context  Guidelines recommend that exercise training be considered for medically stable outpatients with heart failure. Previous studies have not had adequate statistical power to measure the effects of exercise training on clinical outcomes.

Objective  To test the efficacy and safety of exercise training among patients with heart failure.

Design, Setting, and Patients  Multicenter, randomized controlled trial of 2331 medically stable outpatients with heart failure and reduced ejection fraction. Participants in Heart Failure: A Controlled Trial Investigating Outcomes of Exercise Training (HF-ACTION) were randomized from April 2003 through February 2007 at 82 centers within the United States, Canada, and France; median follow-up was 30 months.

Interventions  Usual care plus aerobic exercise training, consisting of 36 supervised sessions followed by home-based training, or usual care alone.

36 sessions of supervised exercise training  
11% lower risk of death or hospitalization

HR 0.89 (95% CI, 0.81-0.99; p=0.03)  JAMA, 2009
The Centers for Medicare & Medicaid Services (CMS) has determined that the evidence is sufficient to expand coverage for cardiac rehabilitation services under 42 C.F.R. § 410.49(b)(1)(vii) to beneficiaries with stable, chronic heart failure defined as patients with left ventricular ejection fraction of 35% or less and New York Heart Association (NYHA) class II to IV symptoms despite being on optimal heart failure therapy for at least six weeks. Stable patients are defined as patients who have not had recent (≤6 weeks) or planned (≤6 months) major cardiovascular hospitalizations or procedures.
## Referral to and Participation in Cardiac Rehab

Factors Associated With Utilization of Cardiac Rehabilitation Among Patients With Ischemic Heart Disease in the Veterans Health Administration

A QUALITATIVE STUDY

David W. Schopfer, MD, MAS; Susan Priano, RN, MSN; Kelly Allsup, BS; Christian D. Helrich, PhD; P. Michael Ho, MD, PhD; John S. Rumsfeld, MD, PhD; Daniel E. Forman, MD; Mary A. Whooley, MD
Only 35 Cardiac Rehab Centers in VHA
Common Barriers

- **Patient-level factors:**
  - Distance from center
  - Lack of transportation
  - Financial constraints
  - Time off from work
  - Limited motivation

- **Provider-level factors**
  - Awareness of guidelines
  - Unsure how to refer

- **System-level factors:**
  - Organizational dynamics
  - Complexity of programs
  - Poor reimbursement

Schopfer D et al, J Cardiovasc Pulm Rehab, 2016 (QUERI RRP 12-232)
Forman D et al, Mayo Clinic Proceedings, In press (QUERI RRP 12-253)
Should We Build New Cardiac Rehab Facilities?
Participation in Cardiac Rehab at 124 VA hospitals (2007-11)

- 35 VA facilities with on-site CR program (30,694 pts)
- 89 VA facilities without on-site CR program (58,132 pts)

**Participation rates:**
- After MI: 45%
- After PCI: 40%
- After CABG: 35%
- Any IHD: 30%

**Significance:**
- After MI: p<0.001
- After PCI: p<0.001
- After CABG: P<0.001
- Any IHD: P<0.001

**Comment:**
- Probably not!

New delivery strategies needed!
Home-Based Cardiac Rehabilitation

• Rationale for cardiac rehabilitation
• Evidence for home-based delivery
• Example programs
• Implementation in VHA
Home- and center-based forms of cardiac rehabilitation seem to be equally effective for improving clinical and health-related quality of life outcomes. This finding supports the continued expansion of home-based programs.

Greater participation in HBCR can offset lower efficacy

\[
\begin{align*}
\text{Facility-Based:} & \quad +++++ \times + + = + + + \\
\text{Home-Based:} & \quad + + \times +++++ = + + +
\end{align*}
\]
Potential Advantages of Home-Based CR

• No wait list/capacity issues
• Customizable and individually tailored
• Flexible scheduling
• No travel/transportation issues
• Greater privacy
• Lower cost
• Integrated with patient’s regular home routine
• Possibly greater adherence and sustainability
Potential Disadvantages of Home-Based CR

• Lack of reimbursement
• Less intensive exercise training
• Lower social support
• Less patient accountability
• Lack of standardization among programs
• Minimal patient monitoring
• Safety concerns for sicker patients
5060 exercise studies in 4250 high risk patients, including:

- N= 1289  Congestive Heart Failure
- N= 598   Hypertrophic Cardiomyopathy
- N= 194   Pulmonary Hypertension
- N= 212   Aortic Stenosis
- N= 686   Age 75 or Older
- N= 1748  Women
- N= 1192  Peak V02 < 14 ml/kg/min

Adverse events in 1/625 studies (no deaths)

Kaiser Permanente MULTIFIT Program

Living Healthier with Multiple Risk Factors for Heart Disease

What is MULTIFIT?
MULTIFIT is a highly effective rehabilitation program for patients who have just had a heart attack, heart bypass surgery, angioplasty or a recent diagnosis of angina. MULTIFIT will support you during your recovery and help you achieve a healthier lifestyle. Designed and researched by Stanford’s Cardiac Rehabilitation Program and Kaiser Permanente, the program helps you lower multiple coronary risk factors so that you can become fit. Hence the name: MULTIFIT.

Healthy Heart Program

Take control of your life.
Begin your journey to a healthier heart!

Introduction
Cardiovascular disease affects more than 1 in 3 American adults and is the leading cause of death in the United States. The Healthy Heart Program is a free, 12-week, home-based, customized exercise and lifestyle program that is intended to help Veterans achieve and maintain optimal cardiovascular health.

http://www.sanfrancisco.va.gov/services/HealthyHeart_.asp
Key Facilitators for Implementation

• Stakeholder engagement
  o CT surgery
  o Cardiology
  o Physical therapy/rehabilitation
  o Nutrition
  o Clinical Applications Coordinator

• Systematic (automated) referral
• Bedside visit during hospitalization for index event
• Multidisciplinary team (nurse, exercise physiologist, dietician, psychologist, physician)
• Tracking of patients

Components of Home-Based CR Program (Summary)

- Automatic referrals (post-CABG, post-PCI order sets)
- Bedside visit by cardiac rehabilitation nurse
- Exercise prescription and physical activity monitoring
- Motivational interviewing and goal setting
- Provision of home exercise equipment (if needed)
- Medication reconciliation and tracking
- Nutrition and weight management
- Stress reduction (including peer support group calls)
- Risk factor management (blood pressure, lipids, smoking)
