

Is There a VA Advantage?

Evidence from Dually Eligible Veterans

David Chan (Stanford & NBER)

David Card (UC Berkeley & NBER)

Lowell Taylor (Carnegie Mellon & NBER)

Poll Question #1

How would you primarily describe yourself?

1. Clinician
2. Researcher
3. Policymaker, manager, or administrator
4. Veteran
5. Other

VA vs. Non-VA

- ▶ Veterans Health Administration (VHA) is the nation's largest health care delivery system
- ▶ Performance of VA vs. non-VA care is important policy question
 - ▶ Medical literature: VA care is better on hundreds of process measures; mixed results on outcomes (e.g., O'Hanlon et al 2017)
 - ▶ Usually compare veterans in the VA with non-veterans in non-VA hospitals
 - ▶ Veterans in the VA generally sicker than non-veterans (Agha et al 2000)
- ▶ Reforms/proposals to privatize the VA (Choice Act of 2014, MISSION Act of 2018)

Broader Motivation

- ▶ Government's role in health care
 - ▶ Should government or the private sector provide health care? (e.g., UK vs. Canada)
 - ▶ Important tradeoff: choice/competition vs. fragmentation
- ▶ Rigorous empirical evaluations are rare
 - ▶ Public and private providers serve different populations, by statute or by patient selection

This Paper

Design:

- ▶ Veterans above age 65 who may use either VA or non-VA care (paid by Medicare)
- ▶ Doyle et al. (2015) [instrumental variables] ambulance design

Findings:

- ▶ In sick population of elderly ambulance riders (28-day mortality of 10 p.p.), VA reduces mortality by 4.5 p.p.
 - ▶ Evidence that sicker veterans use VA, that VA prevents mortality in first critical days
- ▶ Mechanisms:
 - ▶ Compliers have greater VA attachment, are more disadvantaged
 - ▶ Greater effect for sicker, more disadvantaged, and more VA-attached Veterans
 - ▶ VA also reduces spending (more productive)
 - ▶ Suggestive evidence of mechanism through IT and integrated care

Setting and Background

Instrumental Variables

Quasi-Experiment and Main Results

Survival Analysis

Mechanisms

What Are We Comparing?

- ▶ Compared to the VA, private hospitals lag in IT adoption and integration of care
 - ▶ VA adopted health IT 15+ years earlier than private sector (Jha et al. 2009)
 - ▶ Private [non-VA] US health care system fragmented (Cebul et al. 2008; Cutler 2010; Agha et al. 2019)
 - ▶ Note: Not all public hospitals are integrated or have well-functioning IT (e.g., safety net hospitals) but government may be better able to coordinate these investments (Frandsen et al. 2019)

- ▶ In private sector, recent reforms spurred by federal legislation: HITECH Act of 2009 for IT, ACA for Accountable Care Organizations

Poll Question #3

How familiar are you with instrumental variables?

1. Very familiar. I have used them in analysis.
2. I have been taught them but not used them in analysis.
3. I have heard of them but have no formal training.
4. I have never heard of them.

Instrumental Variables

Strong analogy with randomized trials

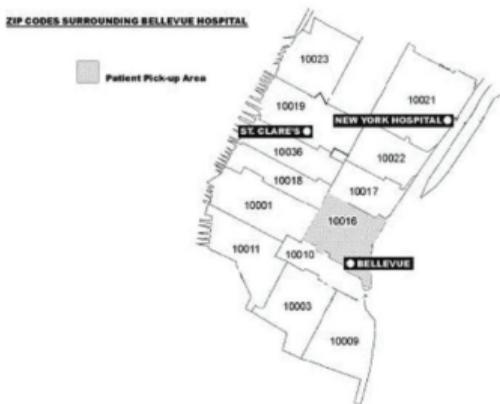

- ▶ Instrument akin to assignment to different trial arms
- ▶ [Quasi-]randomly assigned (**independence**)
- ▶ Drives treatment (**first stage**)
- ▶ Does not otherwise influence outcomes (**exclusion**)

Importantly, allows for non-compliers

- ▶ Scales intention-to-treat (**reduced form**) differences in outcomes to effects among compliers

Ambulance Instrument

- ▶ Doyle et al (2015): Ambulance providers have different propensities to send to different hospitals. In New York:

Destination of Patients Picked Up In The Bellevue Hospital Zip Code Area

Destination	All Voluntary Hospital Ambulances	Fire Department Ambulances
Bellevue Hospital (HHC)	25%*	61%**
Any Voluntary Hospital	75%	39%

*157 taken to Bellevue/632 total. **815 taken to Bellevue/1,346 total

Ambulance Instrument

- ▶ Ambulances may differ in their propensities to send veterans to VA vs. non-VA hospitals (**first stage**):
 - ▶ Ambulance may be affiliated with certain hospitals
 - ▶ Ambulance may have different degrees to which they ascertain whether patient is a Veteran
 - ▶ Ambulance may have base of operation that is closer to VA or non-VA ED
- ▶ Assumptions for quasi-experimental design (**exclusion restriction**):
 - ▶ Ambulance needs to be randomly assigned, *conditional* on zip code
 - ▶ Ambulance cannot directly affect patient health

Outline

Setting and Background

Instrumental Variables

Quasi-Experiment and Main Results

Survival Analysis

Mechanisms

Data

- ▶ VHA administrative records and Medicare claims
 - ▶ Ambulance rides, ED visits in VA and non-VA from 2000 to 2014
 - ▶ Veteran characteristics (diagnoses, utilization) prior to ED visit
 - ▶ Utilization outcomes post ED visit
- ▶ Mortality outcomes (Medicare, VHA, VBA, SSA)
- ▶ Characteristics of VA and non-VA hospitals from AHA, government sources
 - ▶ IT adoption (healthit.gov), Accountable Care Organization (ACO) adoption

Study Sample

- ▶ Dual-eligible (VHA and Medicare) veterans brought in by ambulance
 - ▶ 9.4 million ED visits for 3 million veterans
- ▶ Further restrictions:
 1. Zip codes with VA and non-VA alternatives within 20 miles
 2. Zip codes with 2+ ambulance companies with ≥ 20 rides
 3. Veterans with some VA utilization in past year (for main specifications)
 4. Veterans with no ride in prior month
- ▶ 28-day mortality rate around 10 p.p., weekend share around 2/7 regardless of restrictions

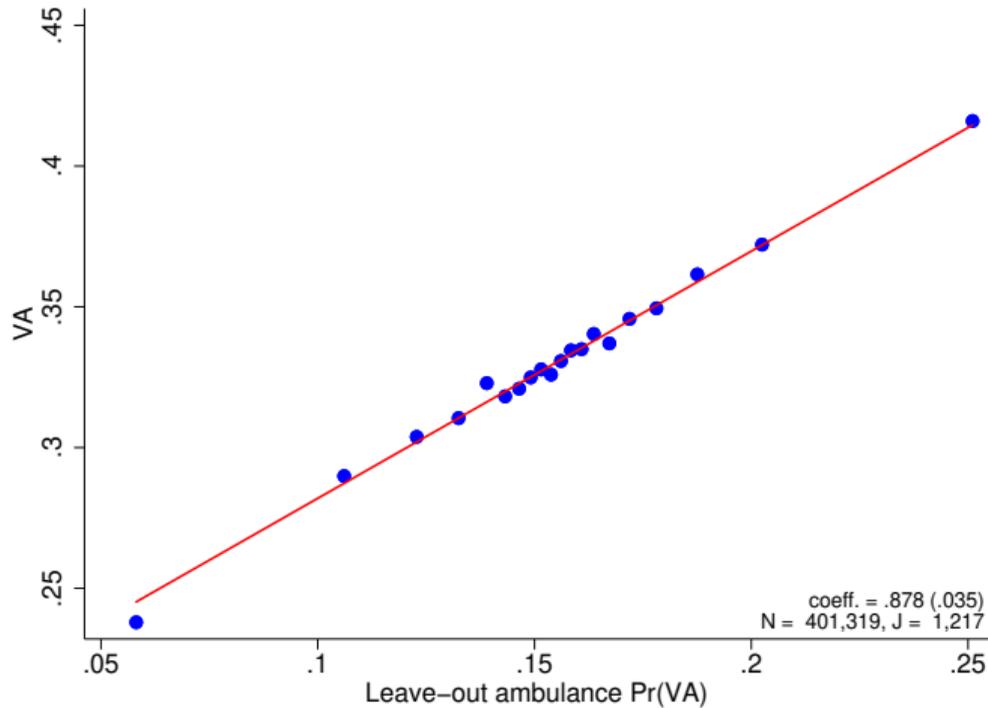

Study Sample

	Dual eligibles	+ zip x hospital	+ zip x ambu- lance	+ VA- attached	+ VA- attached
Male	0.90	0.88	0.86	0.96	0.96
Age	77.0	76.9	76.1	75.6	76.0
Share black	0.11	0.16	0.19	0.20	0.19
Prior VA ED	0.14	0.20	0.26	0.57	0.53
Prior Medicare ED	0.70	0.68	0.63	0.54	0.48
Count comorbidities	6.53	6.69	6.44	6.54	6.14
Weekend rate	0.27	0.27	0.27	0.27	0.27
28-day mortality	0.12	0.11	0.10	0.10	0.10
Present at VA ED	0.04	0.09	0.17	0.34	0.33
Number of rides	8,828,997	3,465,588	1,051,093	491,193	401,319

Empirical Approach: IV vs. OLS

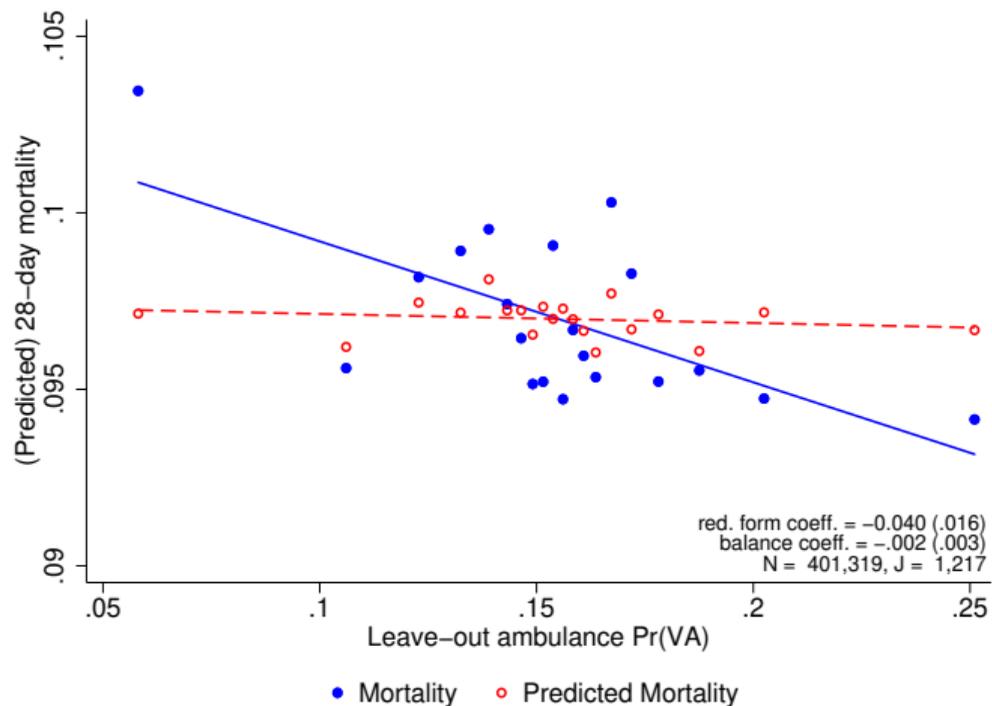

- ▶ Instrumental variables (IV) approach
 - ▶ Propensity of ambulance to send Veterans to the VA
 - ▶ “Jackknife” instrument: measure this propensity based on *other* Veterans it transports
 - ▶ Allows for non-compliers (i.e., Veterans who would never or always go to the VA regardless of the ambulance)
 - ▶ Baseline controls: zip code + source (e.g., residential) + ambulance type (ALS/BLS) + time categories + prior utilization
- ▶ Compare with ordinary least squares (OLS)
 - ▶ Assume that conditional on controls, transport to VA is as good as random
- ▶ Difference between IV and OLS could reflect residual selection bias [or heterogeneous treatment effects]

First Stage

Note: controls for zip code + ambulance source + ALS/BLS + time categories + prior utilization

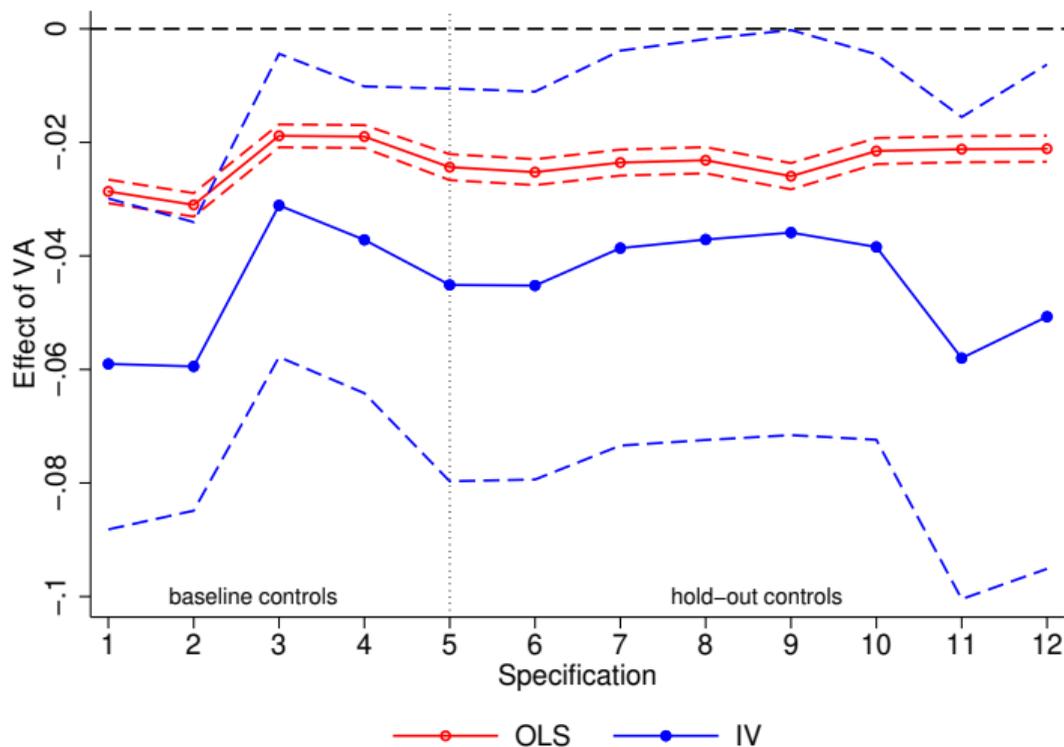

Balance and Intention to Treat

Note: controls for zip code + ambulance source + ALS/BLS + time categories + prior utilization

Robustness

- ▶ Both IV and OLS estimates highly robust regardless of control variables ▶ Variables

Outline

Setting and Background

Instrumental Variables

Quasi-Experiment and Main Results

Survival Analysis

Mechanisms

Survival Analysis

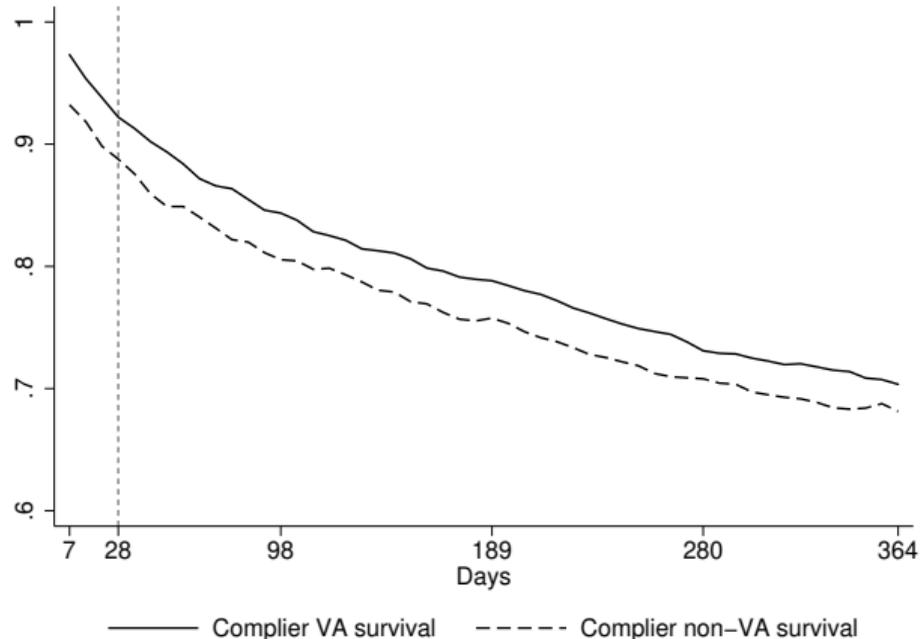

- ▶ Purpose

- ▶ Understand how mortality unfolds over time (e.g., harvesting vs. prevention)

- ▶ Approach

- ▶ Estimate weekly survival *potential outcomes* for compliers sent to VA vs. those sent to non-VA hospitals
 - ▶ The difference between these potential outcomes is the [week-specific] treatment effect
 - ▶ Can also estimate potential *mortality hazard rates*

Complier Survival Curves

Notes: (1) controls for zip code + ambulance source + ALS/BLS + time categories + prior utilization; (2) sample excludes rides with prior ride within last year; (3) potential mortality outcomes $E[Y_{i1} | C]$ and $E[Y_{i0} | C]$ calculated by 2SLS regressions with outcomes $Y_i D_i$ and $Y_i (D_i - 1)$, respectively

Implications

- ▶ Time course
 - ▶ VA advantage arises in week 1 after ED visit, relatively constant thereafter
- ▶ Hazard analysis reveals that mortality hazard is never higher for compliers sent to VA ▶ Hazards
 - ▶ Implies that VA *prevents* rather than *displaces* deaths (no “harvesting”)

Outline

Setting and Background

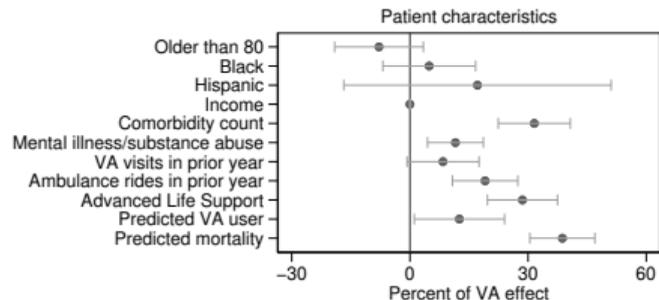

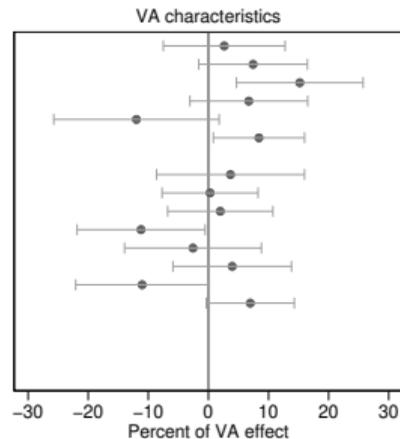

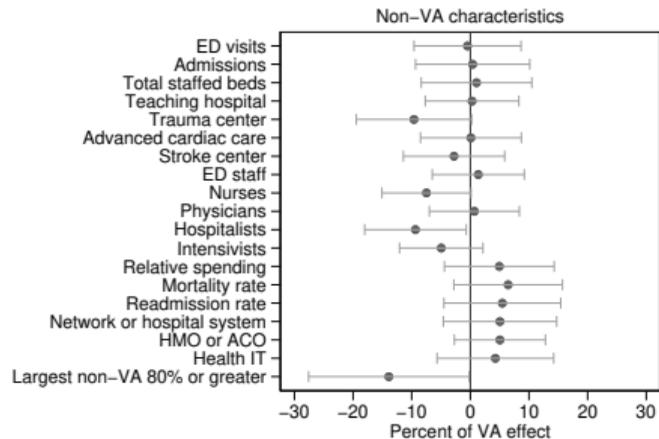

Instrumental Variables

Quasi-Experiment and Main Results

Survival Analysis

Mechanisms

Heterogeneity by Hospitals and Patients

Conclusion

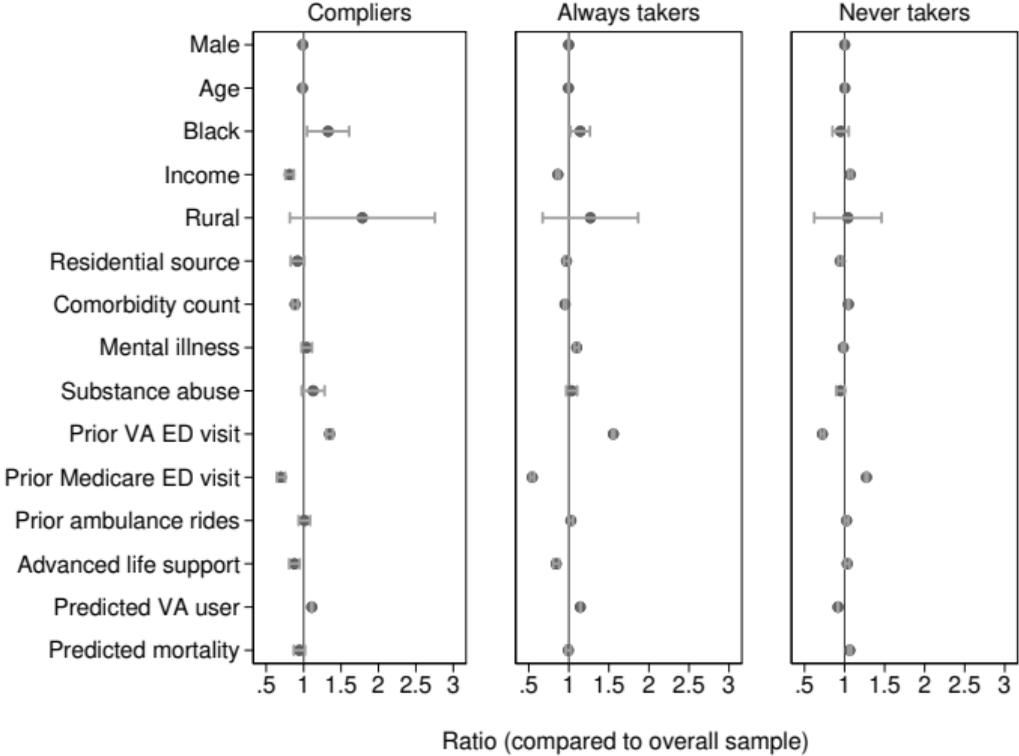

- ▶ Among dually eligible veterans in emergencies, we find VA reduces mortality by 46% at lower cost
 - ▶ Survival gains appear widespread across patients and areas
- ▶ Veterans with higher VA attachment benefit more
 - ▶ Suggestive of continuity of care
 - ▶ Also suggestive evidence of role for IT adoption and integrated care
- ▶ Relevant for understanding productivity in health care sector and for the societal decision of government's role in providing health care

Robustness

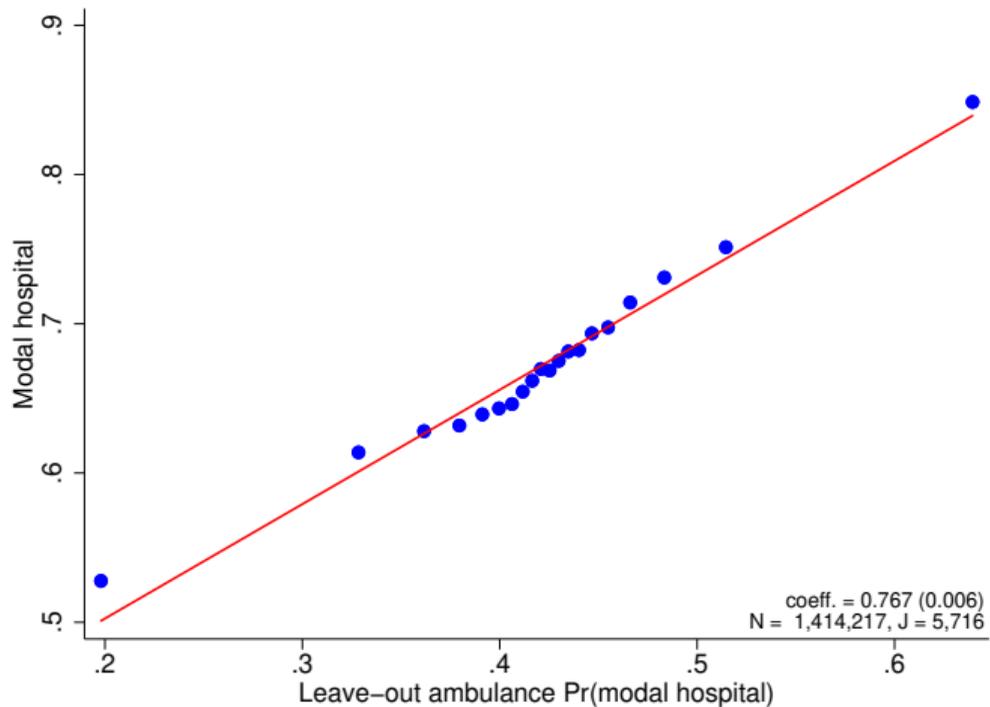

▶ Baseline controls:

1. zip code (1,678 indicators)
2. ambulance source (e.g., residential, clinic) (3 indicators)
3. ambulance ALS/BLS type (3 indicators)
4. time categories (year \times month, day of week) (176 + 6 indicators)
5. prior utilization (primary care, ED, inpatient in VA and non-VA) (6 indicators)

Complier and Non-Complier Characteristics

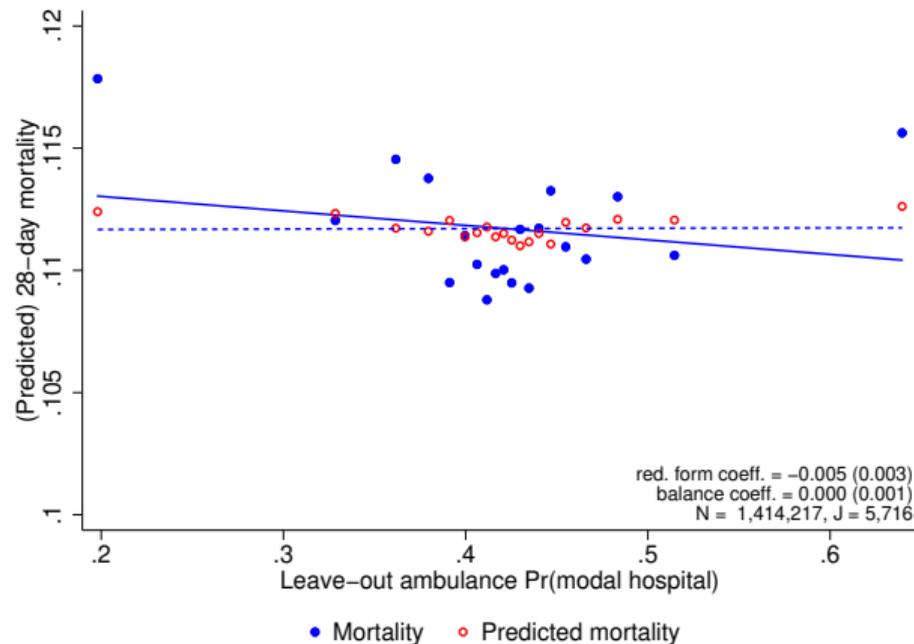

First Stage for Modal Hospital

Note: controls for zip code + ALS/BLS + ambulance source + time categories + prior utilization

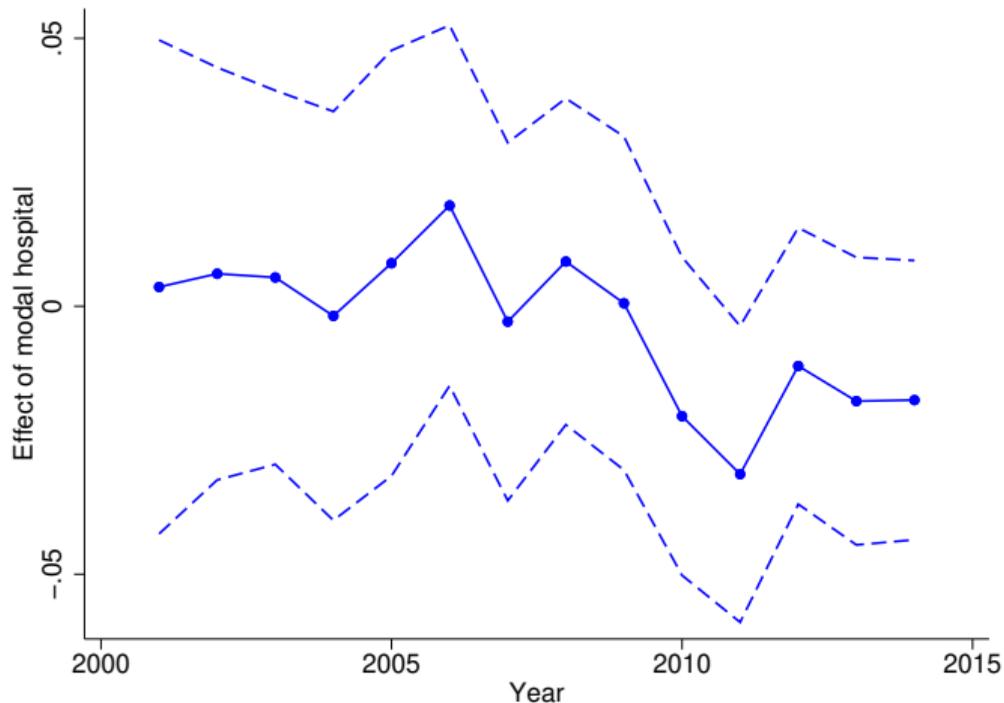

Effect of Modal (Non-VA) Hospital

2SLS Coeff = -0.006 (0.004)

Note: controls for zip code + ambulance source + ALS/BLS + time categories + prior utilization [▶ Back](#)

Effect of Modal Hospital by Year

Note: controls for zip code + ambulance source + ALS/BLS + time categories + prior utilization [Back](#)
