Disclaimer

The contents of this presentation do not represent the views of the Department of Veterans Affairs or the United States government.

Funding Information

- 1) The material in this presentation is based upon work supported by the Department of Veterans Affairs, Pain/Opioid CORE rapid funding start opportunity (PIs: Griffin and Javier).
- 2) This material is based upon work supported by the Department of Veterans Affairs, Veterans Health Administration, Office of Research and Development, Health Services Research and Development (IK2HX002866) and by an NIMH R03 from the University of Washington ALACRITY Center (P50 MH115837) (Tirtanadi).

Poll Q1 – What is your level of experience with human-centered design?

- I've never heard of it
- I've heard of it, but that's about it
- I've used it outside HSR&D (e.g., software development)
- I **informally** use some human-centered or other design practices in my work
- I **formally** use human-centered or other design methods in my work
- I would call myself an expert

Agenda

- Human-centered design (HCD) overview
- Case studies
 - Patient Readiness for Improvement through Motivation, Engagement and Decision-making for PTSD (PRIMED)
 - Rapid Prototyping of Messages to Engage Veterans with Psychosocial Treatments for Chronic Pain
- Things to keep in mind when doing HCD in VA HSR&D research

What is Human-Centered Design

"An approach to interactive systems that aims to make systems usable and useful by focusing on the users, their needs and their requirements"

-National Institute of Standards and Technology

Problem-solving grounded in Empathy

U.S. Department
of Veterans Affairs

HCD and Qualitative Research

Think about how and where these disciplines align

Health Research

Evaluative

"What is going on?"

Human-centered Design

Problem-solving

"How can we fix it?"

HCD Methodology

3 Distinct Phases

Design is
Iterative!

DISCOVER

What's going on?

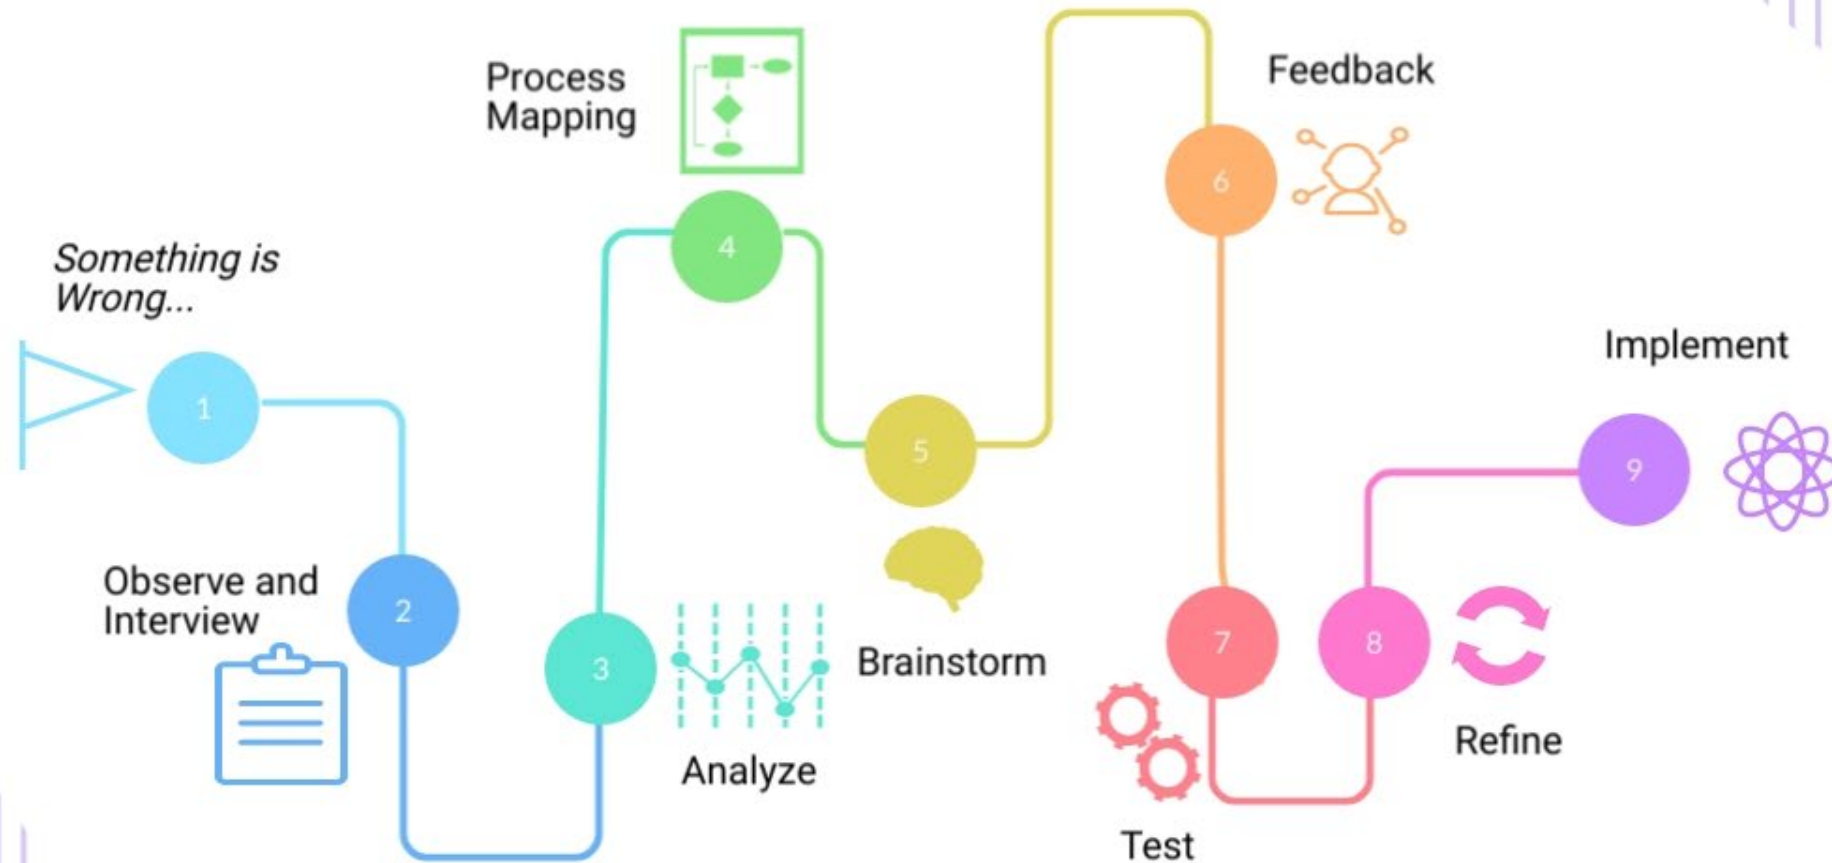

IDEATION

What can we do about it?

IMPLEMENTATION

Does this really solve the problem?

Life of a Design Project

Key Principles of HCD

- Explicit understanding of **users, tasks and environments**
- **Users are involved** throughout the entire process, from design and development to implementation
- Design is **iterative** and refined by user-centered evaluation
- Design looks at the **whole user experience**
- Design employs **multi-disciplinary skills and perspectives**

Finding Solutions

Design is Change

Solutions are tailored to problems.

HCD is not solution-driven.

PATIENT READINESS FOR IMPROVEMENT THROUGH MOTIVATION, ENGAGEMENT AND DECISION-MAKING FOR PTSD (PRIMED)

PI: Jessica Chen, PhD

Health Systems Engineer: Katie Tirtanadi, MSIS, MHA, MA

U.S. Department
of Veterans Affairs

SHARED-DECISION MAKING

Shared-decision making (SDM) is a health communication intervention that supports collaborative treatment decision making between a patient and a provider.

A patient-centered, evidence-based practice that increases patient knowledge and satisfaction and improves treatment retention,^{1,2} including in mental health care.^{3,4}

SDM may improve the uptake of EBPIs in mental health by promoting interest/demand, patient knowledge, and motivation for treatment.⁵

1. Stacey, Légaré, Lewis, Barry, Bennett, Eden, et al. 2017; 2. Légaré, Stacey, Turcotte, Cossi, Kryworuchko, Graham, et al. 2014; 3. Zisman-Ilani, Barnett, Harik, Pavlo & O'Connell 2017; 4. Drake 2018; 5. Karlin & Brenner 2020

USABILITY ISSUES

Shared-Decision Making isn't happening

A decision aid alone does not meet patients' need for trust and interpersonal connection

Education takes too long for patients, requires motivation and access to online resources

SDM takes too long for providers to do in-session and learn out-of-session

DISCOVER

3 major areas to investigate

- I. Understand where SDM lives within the visit (Functional Assessment)
- II. Boil down SDM into its smallest, active components
- III. Find the best vehicle to deliver change (to encourage and accept SDM into practice)

WAVE 1

Learn the Functional Assessment

- Interviews with project experts and participants
- Walkthrough of the visit
- CCC Training Tool

Only 3-4 mins devoted to patient discussion

+	
Advise	
1-2 minutes	<u>Share Options and Discuss Strengths/Needs</u> <i>Specific, personalized options for treatment that are based in the evidence; discussion of how symptoms can be decreased and <u>functioning</u> and quality of life/health improved. Review behavioral change options for addressing identified concerns and implementing next steps*</i>
	<u>Options:</u>
	<u>Strengths/Needs:</u>

DISTILLING SDM

Evidence-Based Psychotherapy Shared Decision-Making Toolkit for Mental Health Providers

Bradley E. Karlin, PhD, ABPP | Amy Wenzel, PhD, ABPP

SHARED DECISION-MAKING SESSION Provider Checklist

This checklist is intended to serve as an in-session guide for conducting the Shared Decision-Making (SDM) Session. Although each of the core components of the SDM Session should be addressed, it is encouraged that the checklist not be used in a rigid manner, and it is not intended for all questions to be asked in all cases. In conducting the session, it is important to remain mindful of the important focus of the session on interpersonal connection and engagement. Discussion should come naturally and fluidly, allowing for revisiting of earlier points of discussion, as needed, while following the guideposts of the session structure.

Remember to use the following foundational skills for establishing connection both initially and throughout the SDM Session:

- **PARAPHRASING:**
Restate patient's remarks in own words.
- **REFLECTION:**
Communicate emotional content (feeling) of patient's verbal and non-verbal communication.
- **SUMMARIZING:**
Provide summary statement pulling together main points communicated by patient.
- **EXPRESSED EMPATHY:**
Express appreciation of patient's internal experience (verbal and nonverbal).
- **GENUINENESS:**
Respond in authentic and transparent manner, truly meaning what is expressed.
- **WARMTH:**
Convey sense of caring, support, and concern (verbal and nonverbal).
- **OPEN-ENDED QUESTIONING:**
Ask questions that require more than a simple yes/no response.
- **CONFIDENCE:**
Convey competence and optimism that treatment will help (verbal and nonverbal).

Patient Readiness for Improvement through Motivation, Engagement, and Decision-making for PTSD (PRIMED-PTSD)

PROTOCOL MANUAL

Adapted from Rave, P. (2010) Shared Decision-Making (SDM) for Elderly Depressed Patients in Primary Care Protocol Manual.

What makes SDM, SDM?

VISIT FRAMEWORK

Shared Decision-Making - Visit Framework

A new approach for PTSD conversations built on Patient Engagement

Connect – “Welcome. Today we’re here to talk about PTSD treatment options. The goal is to find an option that works best for you and what you want.”

“Before we move forward with our discussion, is there anything you want to make sure we talk about?”

1. Build rapport with the patient.
2. Develop interpersonal connection. Build trust, establishing strong relationship
3. Must be an interested, caring and concerned ally

Preparation – “In terms of making decisions, we aim for a shared approach. This means that you, the patient, will ultimately decide what plan you want. I am here to guide you and provide information about each [option](#) but you will decide what you want to do. Does that sound ok with you?”

1. Determine how prepare the patient is for shared decision-making.
2. Reiterate that they will take an active role in deciding their treatment path.
3. Answers will determine if patient is prepared to move to next steps

Motivate – “First, please tell me why you are seeking treatment?”

“Can you tell me about any past experiences you (or someone you know) has had with PTSD treatment?”

“Can you also tell me what would be important to you in terms of a treatment plan?”

1. Determine underlying motivations with inquisitive, empathic, non-directive questions.
2. Explore their attitudes and beliefs about different treatments
3. Look for stereotypes as described by the patient.
4. LISTEN AND WATCH EXPRESSIONS.
5. Listen for *Change Talk* – verbal indicators that patient is unhappy. Ask for elaboration and provide space to embrace all aspects of change talk. These topics initiate from the patient, not provider.

6. The Motivate discussion will determine the degree to which a patient is willing to engage – both consciously and subconsciously.

Educate – “Based on what we’ve been discussing I will outline some options that may appeal to you.”

1. The provider identifies treatment options in line with patient’s motivations as discussed above.
2. The goal is to provide personally relevant treatment information, individualized to enable INFORMED CHOICE.
3. Educate re logistics of these options so patient will have all necessary information to make the best choice for themselves.

Explore – “With a treatment plan, what does the future look like to you?”

1. Want the patient to detail their personal values, vision and beliefs
2. Discuss how these come into play when making decisions (might move this to earlier).

Set Goals (Related to Explore) - “Is there a PTSD treatment we’ve discussed that you believe will help you reach that vision of the future?”

“What goals can we set that can help with this journey?”

1. Apply treatment options to their vision of the future and discuss the variations.
2. What goals can they set for themselves. Look for meaningful steps and activities that are important to individual patient.
3. Provider also needs to assess goals for viability and guide patient towards reasonable, attainable milestones within treatment context.

Choose – “How do you feel about making a decision right now?”

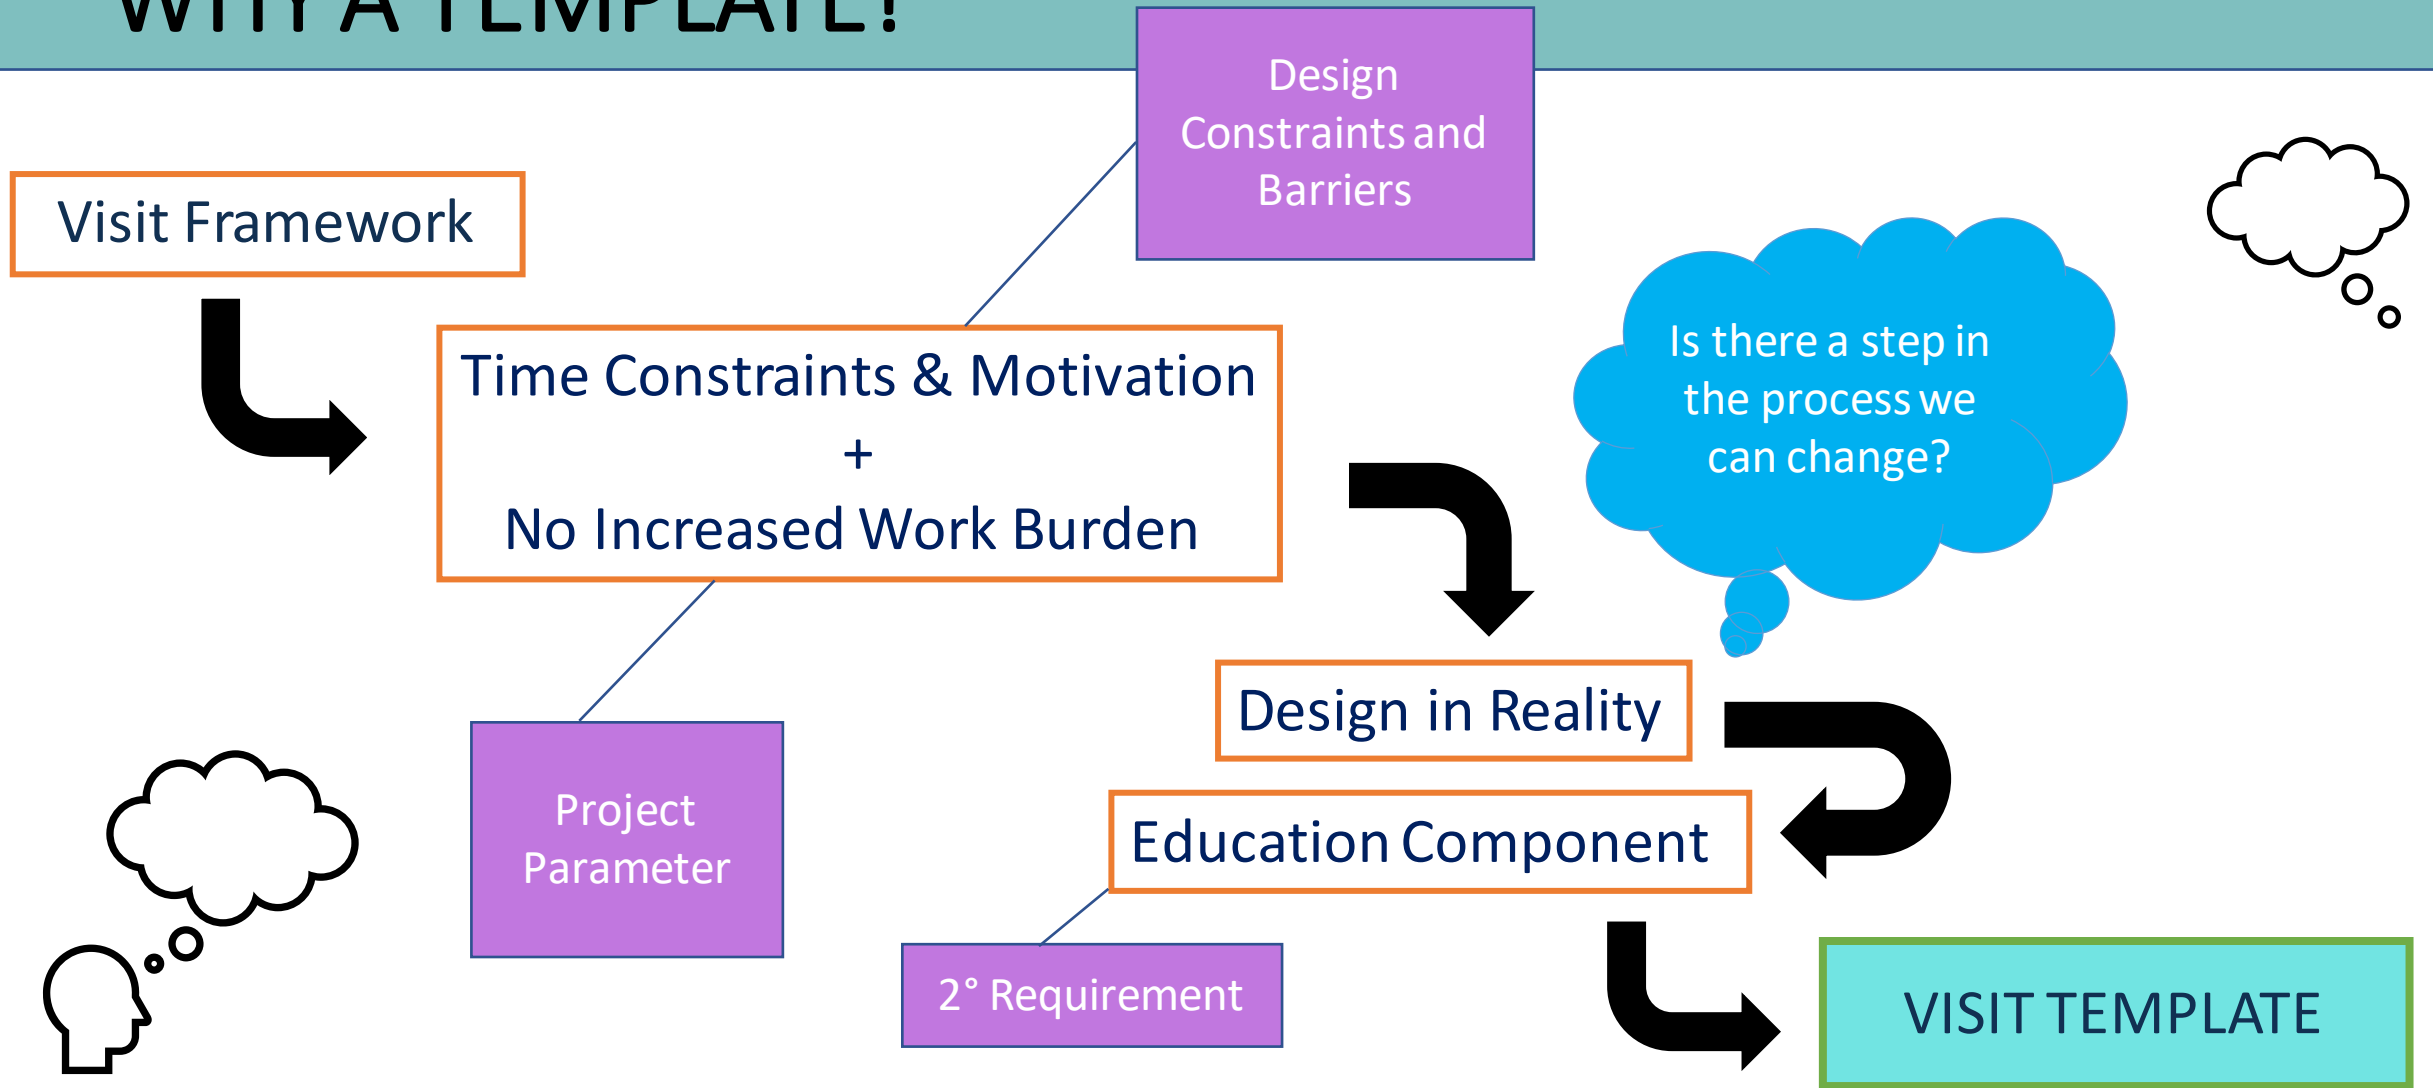

“Is there a treatment option you want to move forward with?”

1. Sometimes the patient will need to discuss options with their support system
2. Create a plan to return to this conversation if no decision is made.
3. Detail next steps if patient makes a treatment decision.
4. This is a joint effort. Revisit the plan whenever either side feels it needs to be revised and create space to discuss why this could happen.

The PRIMED Study

Provider-centered design to support better conversations and decision-making with veterans.

Vehicle for Change: documentation template.

Rapid Prototyping of Messages to Engage Veterans with Psychosocial Treatments for Chronic Pain

PIs: Ashley Griffin, PhD and Sarah Javier, PhD
Center for Innovation to Implementation, VA Palo Alto Healthcare System
Stanford University School of Medicine

Psychosocial Treatments for Chronic Pain

- Evidence-based non-pharmacological approaches are the first line of treatment for chronic pain at the VA (VA Opioid Therapy for Chronic Pain Work Group, 2017)
- Non-pharmacological approaches include treatments that address the psychological (e.g., stress, self-efficacy) and social (e.g., social support, access to resources) aspects of pain:
 - Cognitive Behavioral Therapy for Chronic Pain
 - Acceptance and Commitment Therapy
 - Mindfulness-Based Stress Reduction

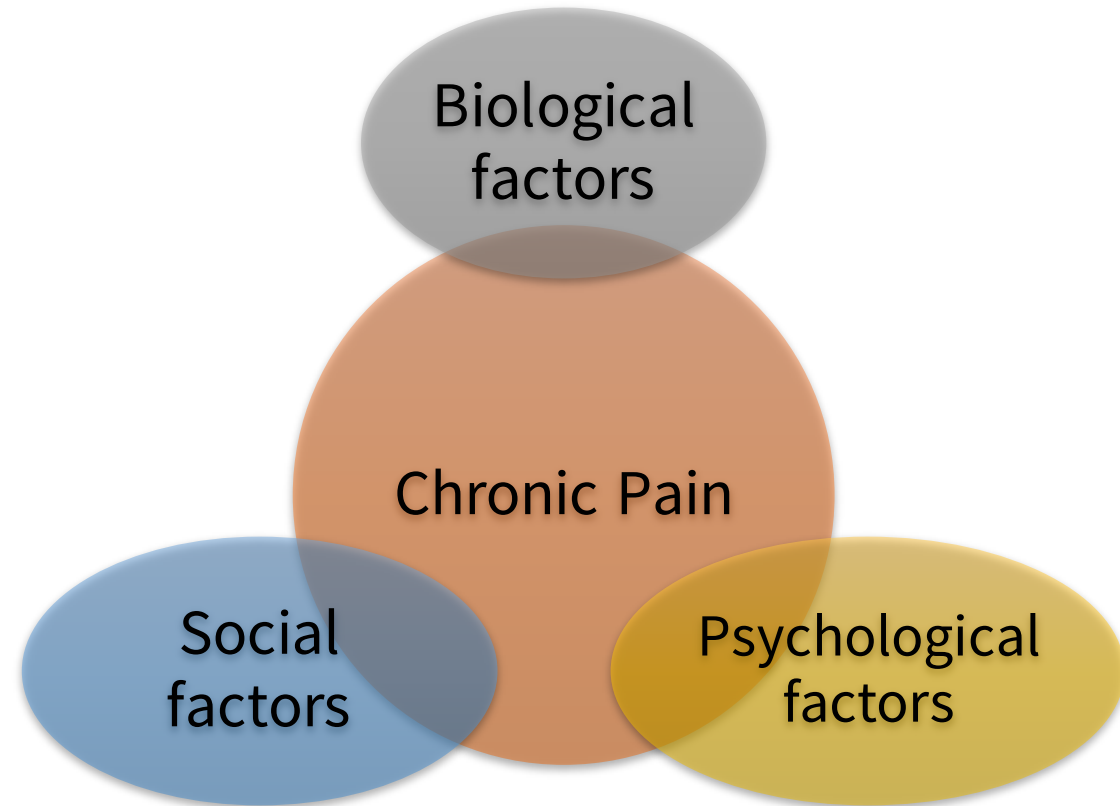

Figure 1.
Biopsychosocial model of chronic pain
(Gatchel, Peng, Peters, Fuchs, & Turk, 2007)

Psychosocial Treatments for Chronic Pain

Cognitive Behavioral Therapy for Chronic Pain (CBT-CP; Murphy, McKellar, Raffa, et al.)

Structured therapeutic approach that focuses on altering the relationships between one's thoughts, feelings, and behaviors

Acceptance and Commitment Therapy (ACT; Hayes, Strosahl, & Wilson)

Action-oriented approach where one focuses on being present, acceptance, personal values, commitment to pursuing important life goals, “self-as-context”, and defusion of negative thoughts

Mindfulness-Based Stress Reduction (MBSR; Kabat-Zinn)

Flexible therapeutic approach combining mindfulness meditation and yoga to decrease stress and stressful thoughts

Technology-Based Interventions

- Patient messaging systems (e.g., portals, text messaging) are promising modalities to disseminate health information
- Support improved knowledge of treatments, self-management, and shared decision-making
- Little is known about patients' perspectives and preferences for message content, modality, timing, and impact on pain-related communication with the care team

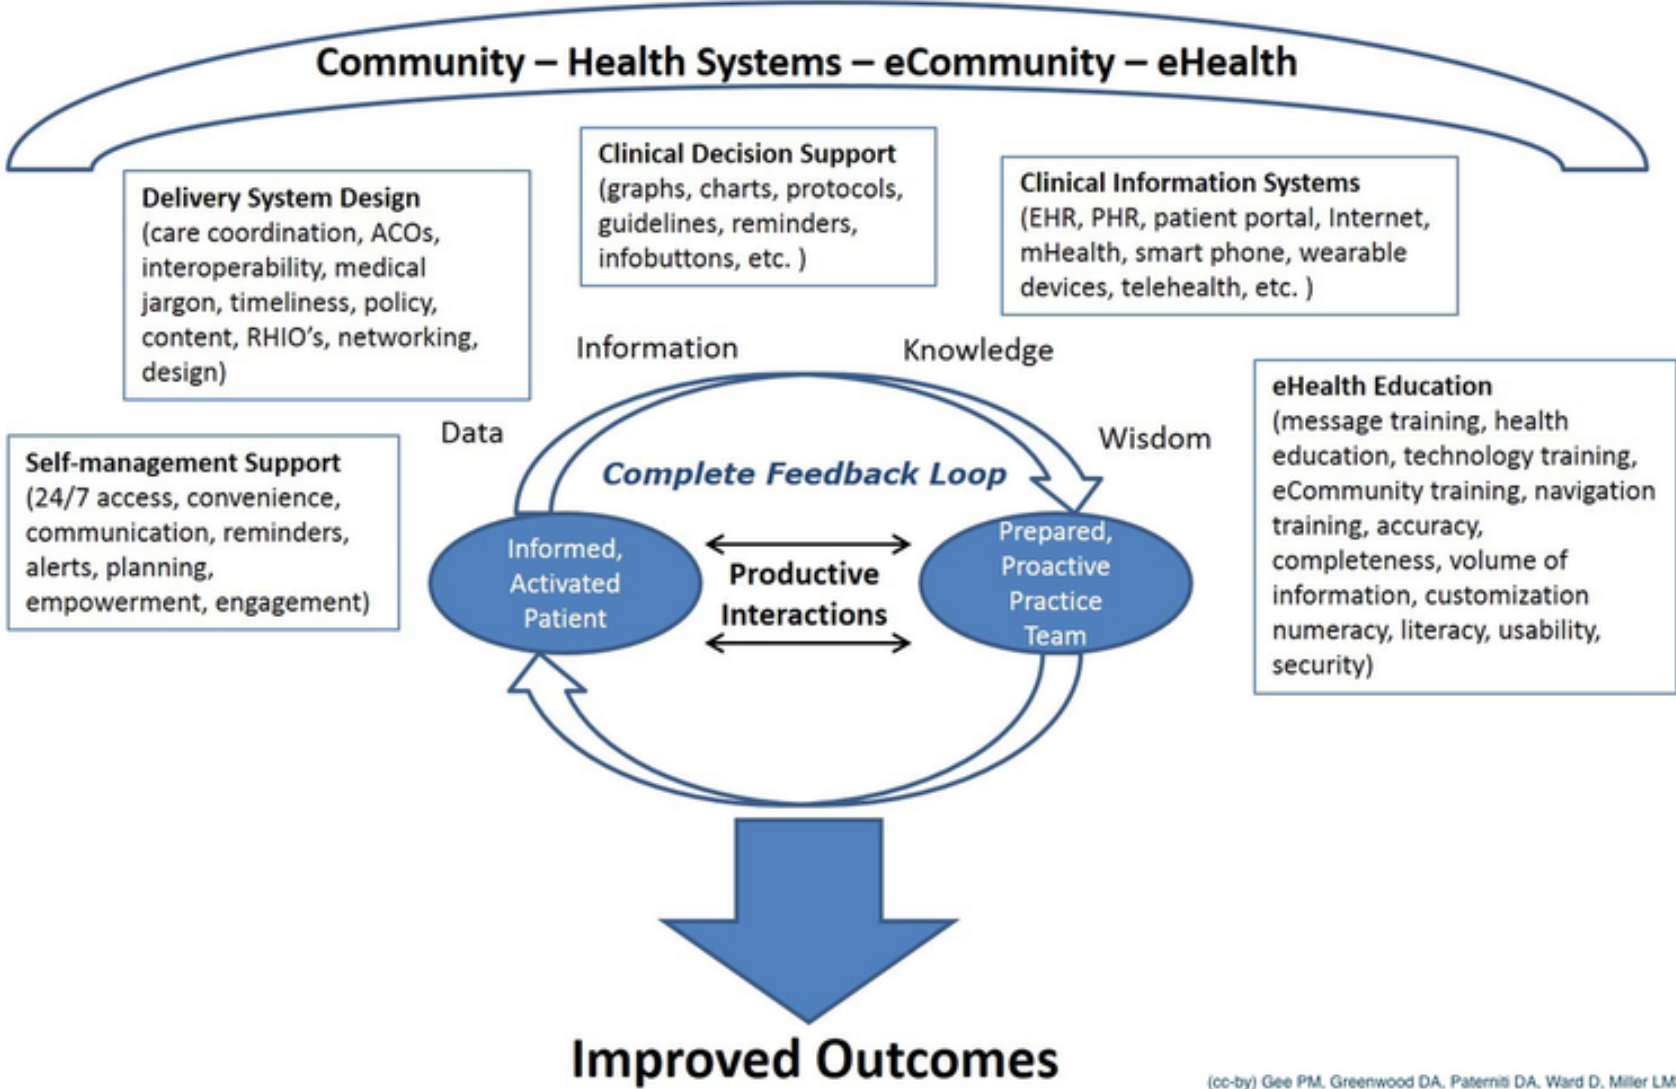

Study Overview

- This is a study funded by the VA Pain/Opioid CORE rapid start funding opportunity
- **Purpose:** Develop messages on psychosocial treatments for chronic pain and obtain feedback on aspects that are valuable to Veterans
- **Approach:**
 - Aim 1. Utilize user-centered, rapid prototyping to refine messages that promote engagement in nonpharmacological behavioral therapies for chronic pain
 - Aim 2. Examine preferences regarding the modality and timing of communication and perceived impact of proactive messages for psychological approaches to chronic pain

The eHealth Enhanced Chronic Care Model (eCCM)

Health Technology Framework

- Illustrates how eHealth tools can help patients improve management of chronic disease
- Used constructs from eCCM to inform broader vision of this work

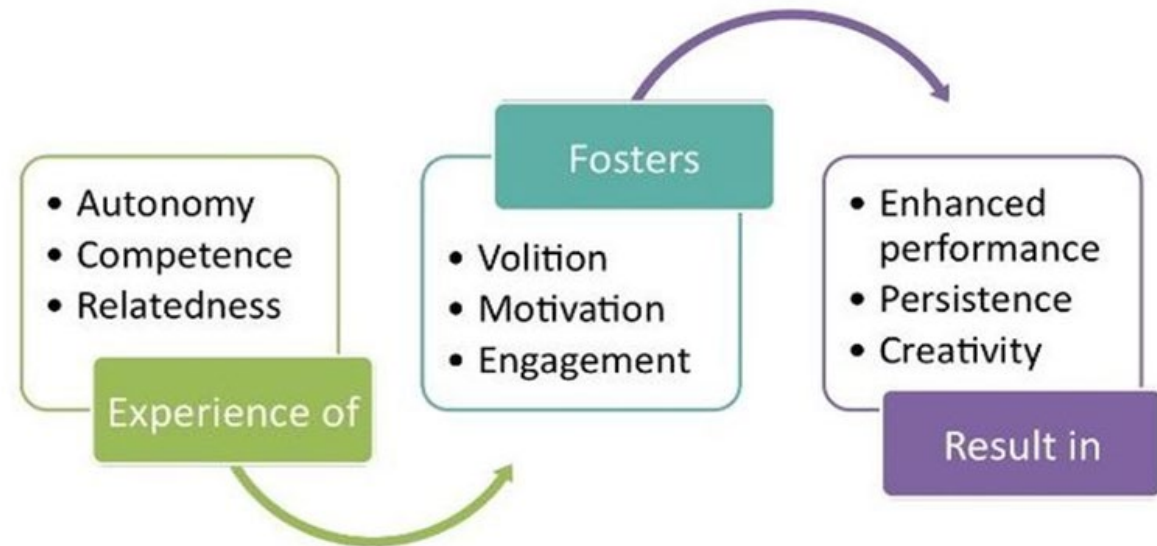

(cc-by) Gee PM, Greenwood DA, Paterniti DA, Ward D, Miller LMS
 J Med Internet Res 2015;17(4):e86, <http://www.jmir.org/2015/4/e86/>

Message Content Framework

- Guided by Self-Determination Theory
- **All humans have three basic psychological needs:** Autonomy, competence, and relatedness
- **Our study question:** *How do we foster the experiences of these psychological needs to motivate individuals to talk to providers and engage with psychosocial pain treatments?*

Self-Determination Theory (SDT)

(Ryan & Deci, 2000)

Motivation and Behavior Change Techniques Used in SDT Interventions

Used motivation and behavior change techniques to guide language in the messages

- Autonomy-support techniques
- Relatedness-support techniques
- Competence support techniques

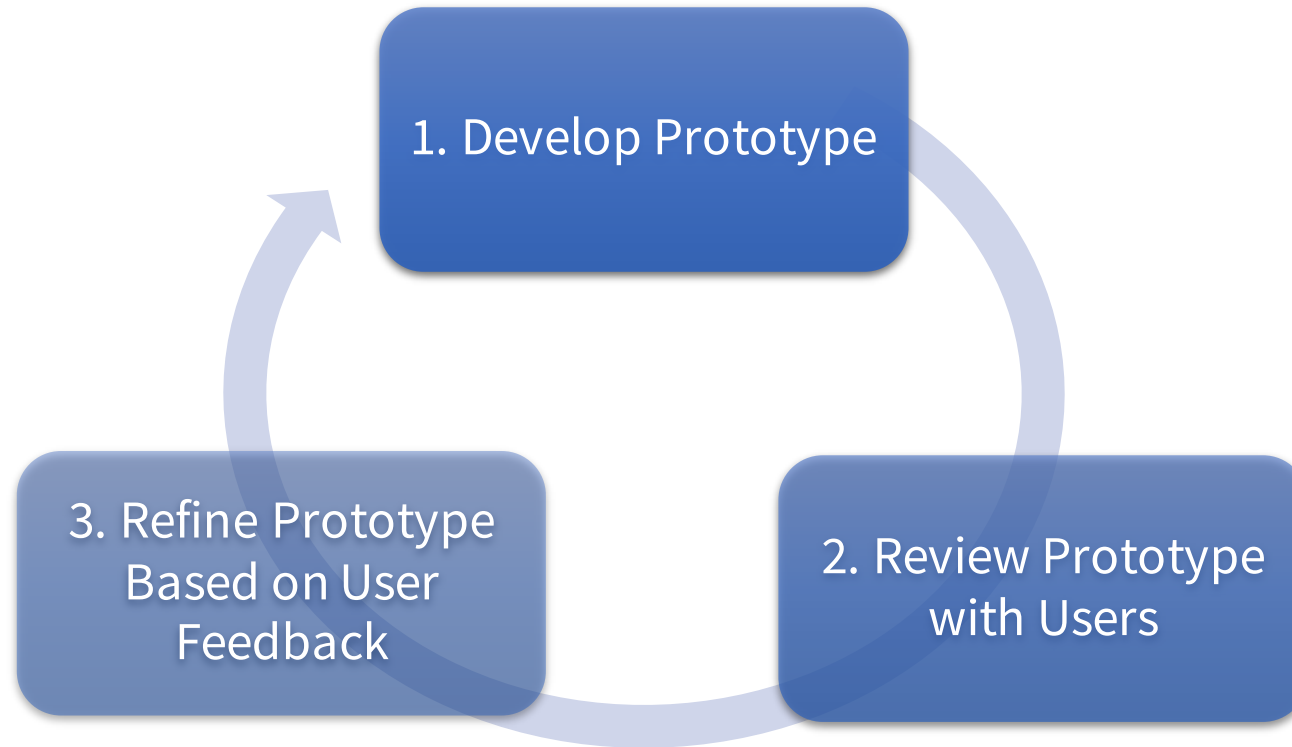

Table 1. (excerpt) Classification of Motivation and Behavior Change Techniques (MBCT)

Label	Definition	Function description
Autonomy-Support Techniques		
MBCT 3. Use non-controlling, informational language	Use informational, non-judgmental language that conveys freedom of choice, collaboration, and possibility when communicating (avoiding constraining, pressuring, or guilt-inducing language). For example, use "might" or "could" instead of "should" and "must".	Avoids being a source of pressure or creating internal pressure, countering external locus of causality for actions.

Teixeira P, et al (2020). A Classification of Motivation and Behavior Change Techniques Used in Self-Determination Theory-Based Interventions in Health Contexts. *Motivation Science*. 6(4):438-455.

Study Design Approach: Rapid Prototyping

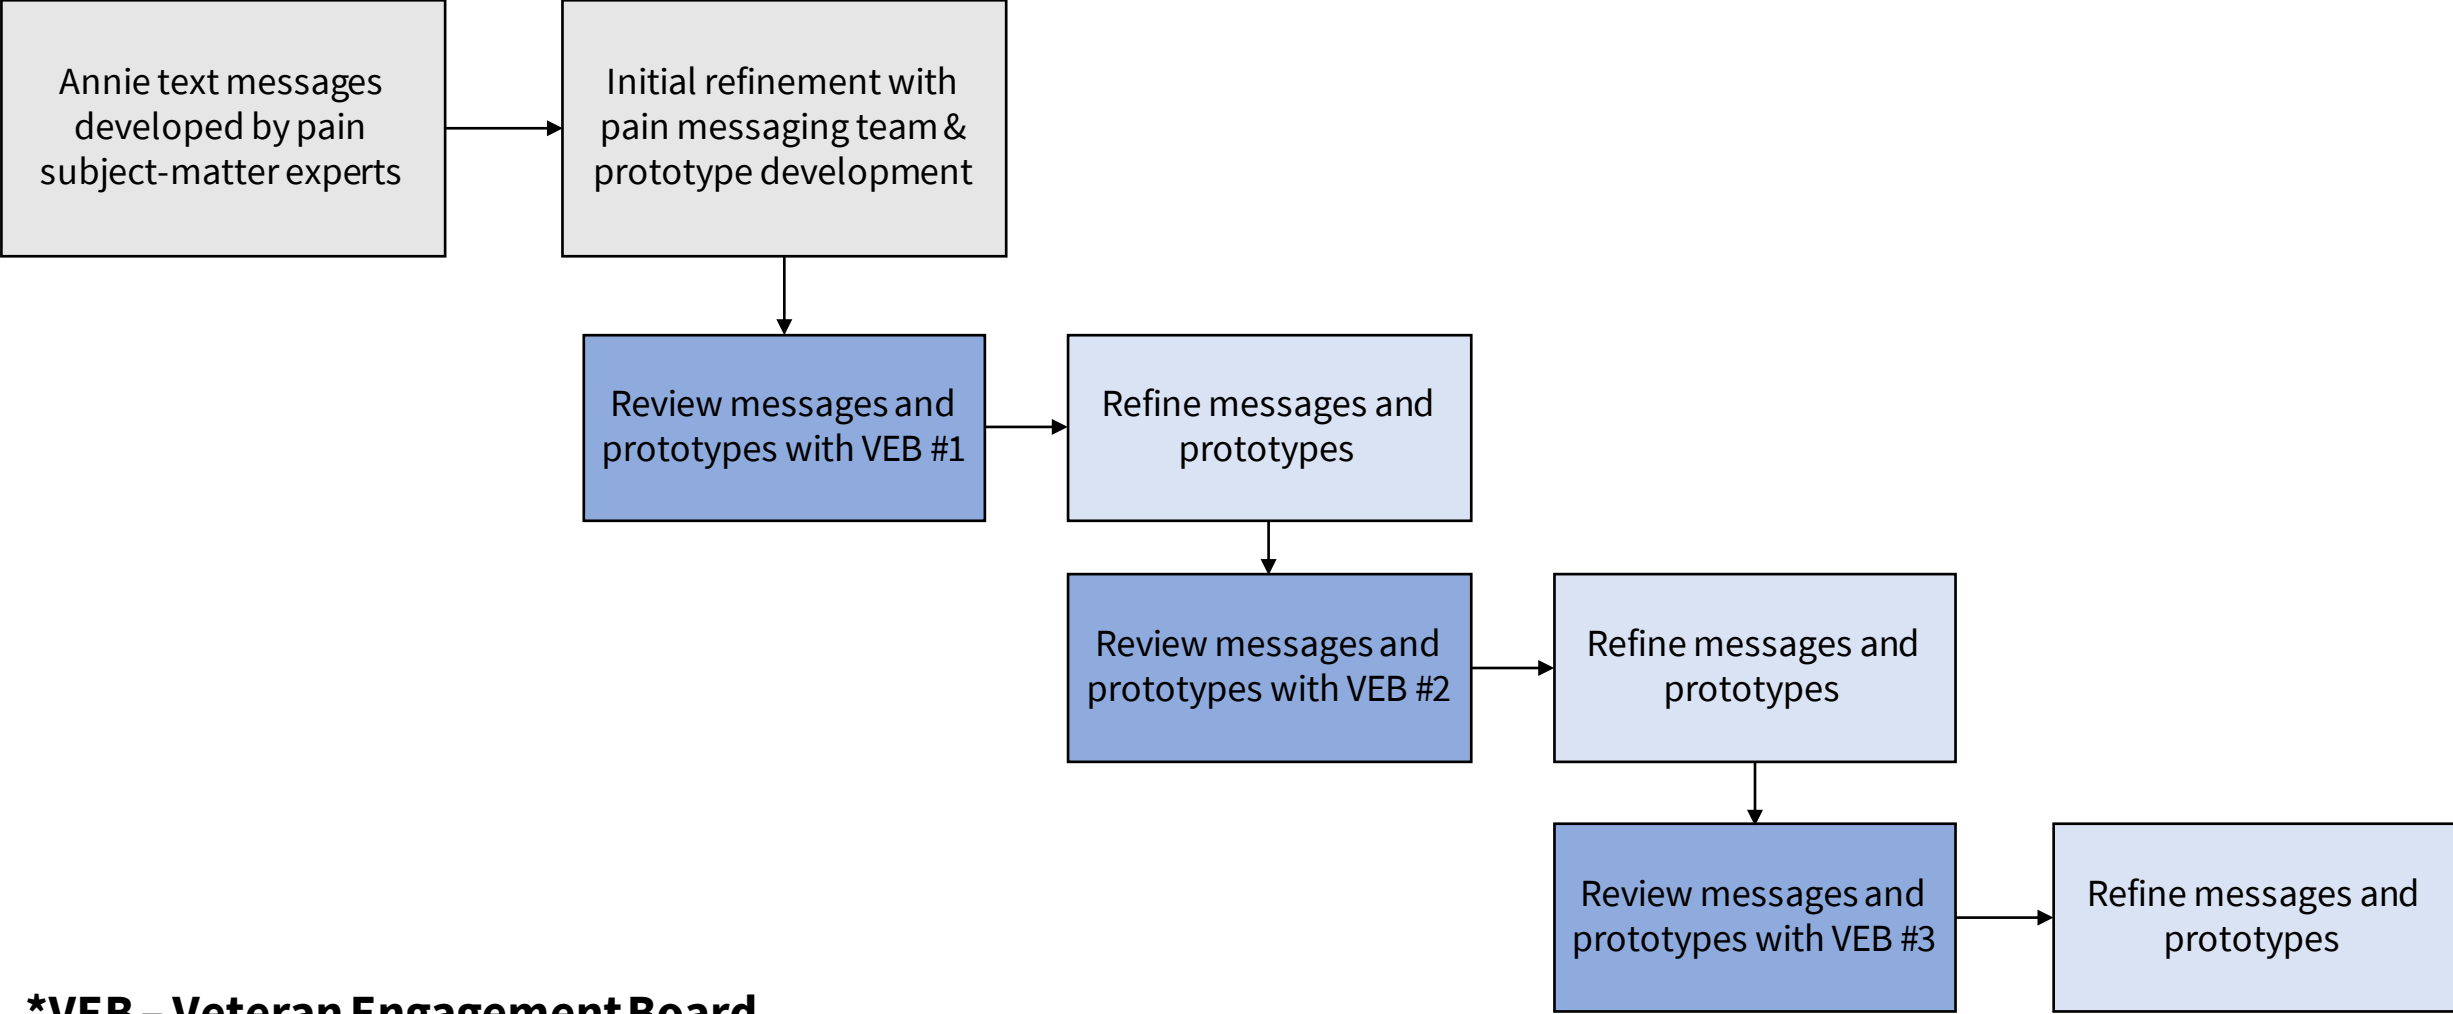

What is it? An evaluative, iterative approach typically used early in a design process that allows individuals to rapidly test and refine a prototype to be used by some target end-user

Rapid Prototyping

Pros	Cons
<ul style="list-style-type: none">• Inexpensive to create prototype• Fast process• Provides test user with an idea of what an end-product will look like and be like• Effective application can be used to identify problems with a product early on	<ul style="list-style-type: none">• Early prototypes may have low fidelity (i.e., low realism) compared to what an end-product will be

Rapid Prototyping Process (Aim 1)

Hello Allen,

You are receiving this e-mail from us because we want to tell you about some treatments available at VA to help you manage your chronic pain. Pain can be complicated and affects many parts of your life: your thoughts, feelings, relationships, and daily activities. But there is good news! There are things you can do to help manage your pain.

Over the next few weeks, we will send you some information about the following topics that cover things you can do to get better control of your pain. **For a quick overview of some of these options, check out this video:** <https://tinyurl.com/HPsyHeadache> or click on the links below:

- **Cognitive Behavioral Therapy** can equip you with problem-solving skills to manage and decrease the challenges of chronic pain. <https://tinyurl.com/CBTcp123>
- **Acceptance and Commitment Therapy** helps you learn new ways to live with pain while making more room for what you find most meaningful and important. <https://tinyurl.com/ACTacceptance>
- **Mindfulness-Based Stress Reduction** teaches you to use mindfulness and meditation techniques to help manage your pain. <https://tinyurl.com/MindfulAwareness>
- **Other self-management strategies** (e.g., sleep and movement) that may help

We encourage you to ask questions about any of these topics to your care team and discuss the options that interest you. Your VA care team is here to support and work with you to help manage your pain.

Thanks,
Veterans Health

From VETERANS HEALTH
To WRENCH, ALLEN
Subject CBT for chronic pain
Message ID 8675309

02 Feb 2022 @ 1041 ET

Message

Hello Allen,

Cognitive Behavioral Therapy for chronic pain (CBT-CP) is a treatment offered at most VA medical centers. CBT-CP is a widely studied and supported psychological treatment for chronic pain. It is based on decades of research and has helped both Veterans and civilians. The approaches learned in CBT-CP may help you do more of the things you would like to do. It will help make pain feel less overwhelming.

CBT-CP consists of a “meet-and-greet” session and 10 therapy sessions with a provider. You can choose to do these sessions in the clinic or from the comfort of your home with most VA providers.

If you decide to participate in CBT-CP, you will be asked to:

- Attend sessions weekly, if possible
- Describe how pain impacts your life
- Work together with your provider to set treatment goals
- Learn about chronic pain and ways to help improve your pain
- Practice new skills in your life outside of sessions

Consider if CBT-CP is right for you by discussing with your family members, peers, and local VA provider.

Thanks,

Veterans Health

Check out the short video at this link to learn about one Veteran's experience with CBT-CP: <https://tinyurl.com/CBTforCP>

Reply

Relaxation and distraction are two ways to help reduce the effect of pain on your life. You can learn about these skills using mindfulness-based stress reduction, MBSR.

Relaxation works by helping to relieve muscle tension, calming your nervous system, and taking your mind off your pain.

In MBSR, you will work with a therapist over several weeks to work on relaxation activities. These activities may include meditation, breathing exercises, and muscle relaxation.

Try the Mindfulness Coach app for meditation exercises to help your pain. It's free! The 8-Min Awareness of the Breath exercise is a good start. Here is the link for the app:
<https://tinyurl.com/Mindfulness-coachapp>

Did you try using relaxation to take your mind off your pain? Type "1" for yes or "2" for no.

Sometimes it takes a lot of repetition, and it doesn't work for everyone on the first try! Here's the link to the app if you would like to try again:
<https://tinyurl.com/Mindfulness-coachapp>

Mindful distraction is another way to help calm your mind. Try a quiet or pleasant activity, like reading a book or calling a friend.

Tell me how you did with taking your mind off your pain. Type "1" for Very well, "2" for Okay, or "3" for Not very well.

Great, keep up the good work. Over time, these changes will help manage your pain.

Consider if MBSR for chronic pain is right for you by discussing with your family members, peers, and local VA provider.

Summary of VEB Feedback

Message Prototype Development

- Guided by motivation and behavior change techniques from Self-Determination Theory
- Prototypes for email, MyHealthVet, and text message

Pain/Opioid CORE Veteran Engagement Panel

- Provide contact information to receive additional details about treatment
- Elaborate on what each treatment involves
- Specify which treatments can be done virtually

VA Palo Alto Veteran and Family Advisory Committee

- Avoid acronyms
- Add more response options for text messages beyond yes/no
- Provide different modes of communication for broader reach (email, MyHealthVet, text message)

Substance Addiction and Recovery Veteran Engagement Board

- Shorten text and add pictures, color, and banners
- Avoid overly positive language (e.g., "But there is good news!")
- Use transitions to remind of the previous messages

Example of Refinement

First prototype:

Acceptance and Commitment Therapy

Hello Allen,

If you sometimes find yourself feeling negative feelings like frustration or sadness when you are in pain, you are not alone! The good news is there's a treatment that can help you manage pain by confronting these feelings head-on: **Acceptance and Commitment Therapy (ACT)** (<https://tinyurl.com/VA-ACT>).

In ACT, you can learn how to accept difficult emotions without judgment. **This can help to clear your mind and feel less anxious about your pain.** Dwelling on things that are out of your control can cause you more stress. ACT can help teach you to accept things that are out of your control.

In ACT, you learn how to embrace your thoughts and feelings related to pain, rather than fighting or feeling guilty for having them. ACT can help you to focus on the present moment and move forward from overwhelming and difficult emotions that you may feel because of your chronic pain.

Consider if ACT for chronic pain is right for you by discussing with your family members, peers, and local VA provider.

Thanks,

Veterans Health

Acceptance and Commitment Therapy

Hello Allen,

If you sometimes find yourself feeling negative feelings like frustration or sadness when you are in pain, you are not alone! The good news is there's a treatment that can help you manage pain by ~~controlling these feelings head-on:~~ **Acceptance and Commitment Therapy (ACT)** (<https://tinyurl.com/VA-ACT>)

At the bottom are buttons for Reply, Reply all, and Forward.

Annotations on the right side of the email:

- More specific subject line
- Avoid overly flowery language
- Make purpose of links explicit
- Description too vague... not sure what ACT entails
- Need more concrete action step and contact number for a real human
- More white space, pictures

VA Acceptance and Commitment Therapy for Chronic Pain

Veterans Health VH123@va.gov
to me
Oct 23, 2022, 2:38pm

Hello Allen,

The previous e-mail we sent you focused on Cognitive Behavioral Therapy for Chronic Pain, and today we want to provide you with information on another therapy: **Acceptance and Commitment Therapy (ACT)**. This therapy can help with sadness when you are in pain (To learn more information, click here: <https://tinyurl.com/VA-ACT>).

ACT is a form of therapy that can teach you how to regain control of your feelings and feel less anxious about your pain. ACT **has six core components**:

Acceptance
Be willing to experience difficult thoughts

Being Present
Focus on the here and now

Values
Discover what is truly important to you

Self as Context
See yourself as unchanged by the time and experience

Commitment
Take action on important things

Defusion
Observe your thoughts without being ruled by them

If you decide to participate in acceptance and commitment therapy, you will work with a therapist over several sessions and engage in hands-on exercises that may include mindfulness meditation, exploration of values, metaphors, imagery, role play, and homework.

Consider if acceptance and commitment therapy for chronic pain is right for you by discussing with your family members, peers, and local VA provider. **To learn more, give us a call at (555) 555-5555 or click on this link:** <https://tinyurl.com/GetStartedACT>

Thanks,
Veterans Health

Next Steps

- Conduct interviews with 30 Veterans to learn about preferences (e.g., modality, timing of communication) and perceived impact of messages for psychological approaches to chronic pain
- Construct a summary of findings for primary care clinicians to elicit feedback
- Develop plan for future implementation of messages for Veterans with chronic pain

Things to keep in mind when doing HCD in VA HSR&D

VA

U.S. Department
of Veterans Affairs

Barriers to HCD in VA HSR&D

- Not an established or recognized methodology in HSR&D research... yet
- Top-down organization
 - End users versus leadership
- Expectations for proposals with a priori solutions
- Limited resources for follow-up evaluation (e.g., maintenance)

Facilitators to HCD in VA HSR&D

- Burgeoning presence of HCD and related approaches in research/QI projects
- Interest and enthusiasm from fellow researchers
- Culture of innovation
- Supportive leadership
- Patience and persistence

“[Human-centered design] does require **embracing uncertainty**, and that can be uncomfortable for people. People need to be **willing to work through a problem without necessarily knowing where they’re going to end up**. For some people that’s really uncomfortable, but I will say **it is worth it** because the **results can be really innovative.**”

-Erin Siminerio, Chief Design Officer
Veterans Experience Office (VEO), VA

We would like to acknowledge the following individuals and entities for their part in this work:
