5	1 or 4	155

## APPENDIX 2. STUDY SELECTION

	Inclusion Criteria	Exclusion Criteria
<b>Population</b>	Adult patients and/or practitioners in cardiology, orthopedic or emergency department clinics EXCEPTION: Study done in within VA, even if it is primary care or another specialty	Must be medical clinic (exclude OR, cardiac cath or laboratory settings) Exclude studies in trauma service settings Exclude Primary care clinics (please tag) Exclude studies involving only children or pediatric clinics; studies including adults and children must stratify results based on age
<b>Intervention</b>	“Medical scribe” or document assistant program that involves navigation of electronic health record system (must provide some information about scribe responsibilities/duties).	“Medical scribe” or “documentation assistant” programs that don’t involve an electronic medical record system Medical transcriptionist or documentation assistant programs that work remotely or transcribe based on physician recordings
<b>Comparator</b>	Any	Studies without a comparison
<b>Outcomes</b>	<p><u>Primary:</u> Clinic efficiency (as measured by): # patients seen per day time to consult time to appt appointment length ED waiting times time in ED (time to hospital admission or discharge to home) left without being seen in ED</p> <p><u>Secondary:</u> Patient satisfaction Practitioner satisfaction Quality of documentation Cost (expenses [scribe-related costs] and revenues [RVU, etc]) Time needed to train scribes Scribe turnover Medical errors</p>	
<b>Timing</b>	Any	Published prior to 2010
<b>Setting</b>	Any location (to include government, private, university-affiliated, and VA facilities worldwide)	

ED=emergency department; OR=operating room; RVU=relative value units

## APPENDIX 3. QUALITY ASSESSMENT CRITERIA

### 3.1 RISK OF BIAS IN NON-RANDOMIZED STUDIES – OF INTERVENTIONS (ROBINS-I)<sup>13</sup>

Bias due to confounding			
Low	Moderate	Serious	Critical
(the study is comparable to a well-performed randomized trial with regard to this domain) No confounding expected.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) (i) Confounding expected, all known important confounding domains appropriately measured and controlled for; <i>and</i> (ii) Reliability and validity of measurement of important domains were sufficient, such that we do not expect serious residual confounding.	(the study has some important problems) (i) At least one known important domain was not appropriately measured, or not controlled for; <i>or</i> (ii) Reliability or validity of measurement of an important domain was low enough that we expect serious residual confounding.	(the study is too problematic to provide any useful evidence on the effects of intervention) (i) Confounding inherently not controllable <i>or</i> (ii) The use of negative controls strongly suggests unmeasured confounding.
Bias in selection of participants into study			
Low	Moderate	Serious	Critical
(the study is comparable to a well-performed randomized trial with regard to this domain) (i) All participants who would have been eligible for the target trial were included in the study; <i>and</i> (ii) For each participant, start of follow up and start of intervention coincided.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) (i) Selection into the study may have been related to intervention and outcome; and the authors used appropriate methods to adjust for the selection bias; <i>or</i> (ii) Start of follow-up and start of intervention do not coincide for all participants; <i>and</i> (a) the proportion of participants for which this was the case was too low to induce important bias; <i>or</i> (b) the authors used appropriate methods to adjust for the selection bias; <i>or</i>	(the study has some important problems) (i) Selection into the study was related (but not very strongly) to intervention and outcome; <i>and</i> This could not be adjusted for in analyses; <i>or</i> (ii) Start of follow up and start of intervention do not coincide; <i>and</i> A potentially important amount of follow-up time is missing from analyses; and the rate ratio is not constant over time.	(the study is too problematic to provide any useful evidence on the effects of intervention) (i) Selection into the study was very strongly related to intervention and outcome; <i>and</i> This could not be adjusted for in analyses; <i>or</i> (ii) A substantial amount of follow-up time is likely to be missing from analyses; <i>and</i> the rate ratio is not constant over time.

	(c) the review authors are confident that the rate (hazard) ratio for the effect of intervention remains constant over time.		
<b>Bias in classification of interventions</b>			
<b>Low</b>	<b>Moderate</b>	<b>Serious</b>	<b>Critical</b>
(the study is comparable to a well-preformed randomized trial with regard to this domain) (i) intervention status is well defined; <i>and</i> (ii) Intervention definition is based solely on information collected at the time of intervention.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) (i) Intervention status is well defined; <i>and</i> (ii) Some aspects of the assignments of intervention status were determined retrospectively.	(the study has some important problems) (i) Intervention status is not well defined; <i>or</i> (ii) Major aspects of the assignments of intervention status were determined in a way that could have been affected by knowledge of the outcome.	(the study is too problematic to provide any useful evidence on the effects of intervention) (Unusual) An extremely high amount of misclassification of intervention status, e.g. because of unusually strong recall biases.
<b>Bias due to deviations from intended intervention</b>			
<b>Low</b>	<b>Moderate</b>	<b>Serious</b>	<b>Critical</b>
(the study is comparable to a well-preformed randomized trial with regard to this domain) <u>Effect of assignment to intervention:</u> (i) Any deviations from intended intervention reflected usual practice; <i>or</i> (ii) Any deviations from usual practice were unlikely to impact on the outcome.  <u>Effect of starting and adhering to intervention:</u> The important co-interventions were balanced across intervention groups, and there were no deviations from the intended interventions (in terms of implementation or adherence) that were likely to impact on the outcome.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) <u>Effect of assignment to intervention:</u> There were deviations from usual practice, but their impact on the outcome is expected to be slight.  <u>Effect of starting and adhering to intervention:</u> (i) There were deviations from intended intervention, but their impact on the outcome is expected to be slight. <i>or</i> (ii) The important co-interventions were not balanced across intervention groups, or there were deviations from the intended interventions (in terms of implementation and/or adherence) that were likely to impact on the outcome; <i>and</i> The analysis was appropriate to estimate the effect of starting and adhering to intervention, allowing for deviations (in terms of implementation, adherence and co-	(the study has some important problems) <u>Effect of assignment to intervention:</u> There were deviations from usual practice that were unbalanced between the intervention groups and likely to have affected the outcome. <u>Effect of starting and adhering to intervention:</u> (i) The important co-interventions were not balanced across intervention groups, or there were deviations from the intended interventions (in terms of implementation and/or adherence) that were likely to impact on the outcome; <i>and</i> (ii) The analysis was not appropriate to estimate the effect of starting and adhering to intervention, allowing for deviations (in terms of implementation, adherence and cointervention) that were likely to impact on the outcome.	(the study is too problematic to provide any useful evidence on the effects of intervention) <u>Effect of assignment to intervention:</u> There were substantial deviations from usual practice that were unbalanced between the intervention groups and likely to have affected the outcome. <u>Effect of starting and adhering to intervention:</u> (i) There were substantial imbalances in important cointerventions across intervention groups, or there were substantial deviations from the intended interventions (in terms of implementation and/or adherence) that were likely to impact on the outcome; <i>and</i> (ii) The analysis was not appropriate to estimate the effect of starting and adhering to intervention, allowing for deviations (in terms of implementation, adherence and cointervention) that were likely to impact on the outcome.

	intervention) that were likely to impact on the outcome.		
<b>Bias due to missing data</b>			
<b>Low</b>	<b>Moderate</b>	<b>Serious</b>	<b>Critical</b>
(the study is comparable to a well-preformed randomized trial with regard to this domain) (i) Data were reasonably complete; <i>or</i> (ii) Proportions of and reasons for missing participants were similar across intervention groups; <i>or</i> (iii) The analysis addressed missing data and is likely to have removed any risk of bias.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) (i) Proportions of and reasons for missing participants differ slightly across intervention groups; <i>and</i> (ii) The analysis is unlikely to have removed the risk of bias arising from the missing data.	(the study has some important problems) (i) Proportions of missing participants differ substantially across interventions; <i>or</i> Reasons for missingness differ substantially across interventions; <i>and</i> (ii) The analysis is unlikely to have removed the risk of bias arising from the missing data; <i>or</i> Missing data were addressed inappropriately in the analysis; <i>or</i> the nature of the missing data means that the risk of bias cannot be removed through appropriate analysis.	(the study is too problematic to provide any useful evidence on the effects of intervention) (i) (Unusual) There were critical differences between interventions in participants with missing data; <i>and</i> (ii) Missing data were not, or could not, be addressed through appropriate analysis.
<b>Bias in measurement of outcomes</b>			
<b>Low</b>	<b>Moderate</b>	<b>Serious</b>	<b>Critical</b>
(the study is comparable to a well-preformed randomized trial with regard to this domain) (i) The methods of outcome assessment were comparable across intervention groups; <i>and</i> (ii) The outcome measure was unlikely to be influenced by knowledge of the intervention received by study participants (i.e. is objective) or the outcome assessors were unaware of the intervention received by study participants; <i>and</i> (iii) Any error in measuring the outcome is unrelated to intervention status.	(the study is sound for a nonrandomized study with regard to this domain but cannot be considered comparable to a well-performed randomized trial) (i) The methods of outcome assessment were comparable across intervention groups; <i>and</i> (ii) The outcome measure is only minimally influenced by knowledge of the intervention received by study participants; <i>and</i> (iii) Any error in measuring the outcome is only minimally related to intervention status.	(the study has some important problems) (i) The methods of outcome assessment were not comparable across intervention groups; <i>or</i> (ii) The outcome measure was subjective (i.e. vulnerable to influence by knowledge of the intervention received by study participants); <i>and</i> the outcome was assessed by assessors aware of the intervention received by study participants; <i>or</i> (iii) Error in measuring the outcome was related to intervention status.	(the study is too problematic to provide any useful evidence on the effects of intervention) The methods of outcome assessment were so different that they cannot reasonably be compared across intervention groups.
<b>Bias in selection of the reported result</b>			
<b>Low</b>	<b>Moderate</b>	<b>Serious</b>	<b>Critical</b>
(the study is comparable to a well-preformed randomized trial with regard to this domain)	(the study is sound for a nonrandomized study with regard to this domain but cannot	(the study has some important problems)	(the study is too problematic to provide any useful evidence on the effects of intervention)

<p>There is clear evidence (usually through examination of a pre-registered protocol or statistical analysis plan) that all reported results correspond to all intended outcomes, analyses and subcohorts.</p>	<p>be considered comparable to a well-performed randomized trial)                  (i) The outcome measurements and analyses are consistent with an a priori plan; <i>or</i> are clearly defined and both internally and externally consistent;  <i>and</i>                  (ii) There is no indication of selection of the reported analysis from among multiple analyses;  <i>and</i>                  (iii) There is no indication of selection of the cohort or subgroups for analysis and reporting on the basis of the results.</p>	<p>(i) Outcomes are defined in different ways in the methods and results sections, or in different publications of the study;  <i>or</i>                  (ii) There is a high risk of selective reporting from among multiple analyses;  <i>or</i>                  (iii) The cohort or subgroup is selected from a larger study for analysis and appears to be reported on the basis of the results.</p>	<p>(i) There is evidence or strong suspicion of selective reporting of results;  <i>and</i>                  (ii) The unreported results are likely to be substantially different from the reported results.</p>
--	--	--	--

### 3.2 COCHRANE RISK OF BIAS ASSESSMENT<sup>14</sup>

Domains	Low	Unclear	High
Randomization generation Allocation concealment Blinding of participants and personnel Blinding of outcome assessors Incomplete outcome data Selective reporting	Plausible bias unlikely to seriously alter the results.	Plausible bias that raises some doubt about the results.	Plausible bias that seriously weakens confidence in the result

## APPENDIX 4. QUALITY ASSESSMENT FOR ELIGIBLE PUBLICATIONS

## APPENDIX 5. PEER REVIEW COMMENTS/AUTHOR RESPONSES

Question	Reviewer Number	Comment	Author Response
Are the objectives, scope, and methods for this review clearly described?	1	Yes	Thank you.
	2	Yes	
	3	Yes	
	4	Yes	
Is there any indication of bias in our synthesis of the evidence?	1	No	Thank you.
	2	No	
	3	No	
	4	No	
Are there any published or unpublished studies that we may have overlooked?	1	No	Thank you.
	2	No	
	3	No	
	4	No	
Additional suggestions or comments can be provided below. If applicable, please indicate the page and line numbers from the draft report.	1	Nice job on this! The executive summary could use another round of proofreading.	Thank you for the comment, we have proofread the executive summary and made edits as necessary.
	2	Suggested changes, subtle and at the authors discretion.  Page 2, line 50: Data was not pooled; rather narratively synthesized. Page 3, line 32: Are the quotations necessary? Page 3, line 41: Take out and and make separate sentence thereafter. Feels run on. Page 3, line 45: KQ1 not previously defined and never is. Needs to be now or before introducing.	Thank you for the suggestions, edits have been made as appropriate.  The Key Questions are initially introduced at the end of the introduction on page 1-2.
	4	Recommended edits: p. ii, line 36- correct credentials, Storm Morgan, MSN, MBA, RN p. 4, line 30- "in" appears to be an extra word p.5, line 24 and p.42, line 14-15. Word through put should be one word p. 8, line 9-10- nurse practitioners are a form of advanced practice nurses so listing both entries seems unusual. I expected to see physicians, nurse practitioners, and physician assistants. p. 34, line 8-9- Is the forward slash correct for 7.61/(456.6 mins)?	Thank you for the suggestions, edits have been made as appropriate.

## APPENDIX 6. EVIDENCE TABLES

Appendix Table 6-1. Characteristics of Cardiology Studies

Author, year Study Design Funding Source Risk of Bias Study Period	Description of Study	Scribe Training/Experience Scribe Duties	Patient Baseline Measures		Primary Objective Outcomes
			Scribe	Non-scribe	
<p><b>Bank, 2015<sup>29</sup></b> Retrospective observational  Funding NR  Serious ROB  2014</p>	<p>Ten cardiologists who used scribes were compared to 15 cardiologists who did not over a 1-year period in a single center clinic. Sixteen scribes helped the 10 cardiologists, some were paired with a physician, but many physicians worked with several different scribes over the year. All patient clinic visits were tracked. Patients seen at outreach sites, in device clinic, or in urgent care clinic were not included.</p> <p>For physicians without scribes, patients were scheduled 20 minutes for follow-up and 40 minutes for new patient visits. Every 4 hours, one follow-up slot was left unscheduled for physicians to “catch up” with dictation/documentation. For physicians using scribes, the open 20-minute slot every 4 hours was eliminated; resulting in 22 and 24 scheduled patients per 8-hour day, respectively.</p> <p>Revenue was tracked on new and follow-up patients to estimate revenues.</p>	<p><b>Scribe training:</b> Scribes provided by vendor service with 6 years’ experience; 184 hours total training, including terminology, classroom lecture, on-floor training, supervised scribing and reviews with supervisor</p> <p>Cardiology-specific training included terminology, review of templates and clinic processes, shadowing a scribe and review of common cardiology diagnoses</p> <p><b>Scribe duties:</b> Reviewed charts prior to clinic visits, generated preliminary notes using a template provided by each physician, recorded historical information during clinic visits, transcribed information provided by the physician after clinic visits, and completed scheduling, billing, patient instruction, and after-visit summary forms under the direction of the physician.</p>	NR	NR	<p><b>Physician productivity</b></p> <ul style="list-style-type: none"> <li>• Patients per hour</li> <li>• Patients seen per year per physician</li> <li>• Average direct revenue</li> <li>• Downstream revenue</li> </ul>

**Abbreviations:** NR=not reported; ROB=risk of bias

**Appendix Table 6-2. Reported Outcomes from Cardiology Studies**

Author, year Study design	Clinic Efficiency		Financial Productivity	Relative Value Units	Quality of Documentation
	Scribe (n=10)	Non-scribe (n=15)			
<b>Bank, 2015<sup>29</sup></b> Retrospective observational	<p><b>New patients seen per year</b> N=955 New patients per year per provider: 955/10=95.5</p> <p><b>Follow-up patients seen per year</b> N=4830 Follow-up patients per year per provider: 4830/10=483</p> <p><b>Patients/hour</b> 2.50 +/-0.27 P=0.01 9.6% more patients/hour (increased productivity)</p>	<p><b>New patients seen per year</b> N=1318 New patients per year per provider: 1318/15=87.9</p> <p><b>Follow-up patients seen per year</b> N=7150 Follow-up patients per year per provider: 7150/15=476</p> <p><b>Patients/hour</b> 2.28 +/-0.15</p>	<p>“The use of scribes resulted in ...an additional annual revenue of \$1,372,694 at a cost [for the scribes] of \$98,588.”</p> <p>“Physicians with scribes also generated an additional revenue of \$24,257 by producing clinic notes that were coded at a higher level.”</p>	<p>“The use of scribes resulted in the generation of 3,029 wRVUs”</p>	<p>“The level of coding varied significantly (P=0.001 for new patients, P=0.017 for follow-up patients) between physicians using scribes and those who did not. In particular, the number of new and follow-up patients coded at the highest level was higher for the physicians with scribes.”</p> <p>“the higher level of service associated with visits using a scribe suggests that documentation may be better during those visits.”</p>

<b>Length of stay</b>								
<b>Walker, 2019<sup>35</sup></b> RCT ROB: Moderate	Decrease in length of stay with scribes versus no scribes (173 vs 192 minutes)	N=3,885 shifts N=28,936 patients N=88 clinicians	Moderate	Direct	Precise	Unknown	Undetected	Moderate <sup>a</sup>
<b>Patients per hour</b>								
<b>Walker, 2019<sup>35</sup></b> RCT ROB: Moderate	Increase in patients per hour per clinician with scribes versus no scribes (1.13 [1.11 to 1.17] vs 1.31 [1.25 to 1.38], absolute difference: 0.18 (0.12 to 0.24) increase <0.001 )	N=4790 shifts N=28936 patients N=88 clinicians	Moderate	Indirect	Imprecise	Consistent	Undetected	Low <sup>a,b</sup>
<b>Friedson, 2018<sup>45</sup></b> RCT ROB: Moderate	Increase in patients per shift with scribes versus no scribes (18.6 vs 17.8, difference 0.80, p<.05)							
<b>Relative value units</b>								
<b>Friedson, 2018<sup>45</sup></b> RCT ROB: Moderate	No difference in relative value units per shift (MD=2.14) but an increase in trimmed relative value units per shift (MD=4.87) with scribes versus no scribes	N=905 shifts	Moderate	Direct	Precise	Unknown	Undetected	Moderate <sup>a</sup>

MD=mean difference; RCT=randomized controlled trial; ROB=risk of bias

<sup>a</sup>Downgraded one level for risk of bias

<sup>b</sup>Downgraded one level for imprecision, difficult to interpret based on the variability in the reporting of the effects

**Appendix Table 7.3 Certainty of Evidence Tables for Emergency Department Studies: Observational Studies**

Study Risk of Bias	Findings	Sample Size	Study limitations	Directness	Precision	Consistency	Publication Bias	Overall grade
<b>Length of Stay</b>								
<b>Allen, 2014</b> <sup>42</sup> Pre-post ROB: Serious	Decrease in length of stay with scribes versus no scribes (233 vs 249 minutes)	N=1,042 shifts N=49,445 patients N=23,319 encounters N=103 clinicians	Serious	Direct	Imprecise	Inconsistent	Undetected	Very Low <sup>a,b,c</sup>
<b>Arya, 2010</b> <sup>43</sup> Pre-post ROB: Moderate	No difference with scribes versus no scribes							
<b>Bastani, 2014</b> <sup>44</sup> Pre-post ROB: Serious	Decrease in length of stay with scribes versus no scribes (269 vs 289 minutes)							
<b>Heaton, 2016</b> <sup>36</sup> Pre-post ROB: Serious	Increase in length of stay with scribes versus no scribes (265 vs 255 minutes)							
<b>Heaton, 2017a</b> <sup>37</sup> Pre-post ROB: Moderate	No difference with scribes versus no scribes							
<b>Heaton, 2019a</b> <sup>41</sup> Pre-post ROB: Serious	No difference with scribes versus no scribes							
<b>Hess, 2015</b> <sup>47</sup> Pre-post ROB: Serious	No difference with scribes versus no scribes							
<b>Shuaib, 2017</b> <sup>49</sup> Pre-post ROB: Serious	Decrease in length of stay with scribes versus no scribes (287 vs 303 minutes)							
<b>Walker, 2016a</b> <sup>31</sup> Pre-post ROB: Serious	No difference with scribes versus no scribes							
<b>Patients per hour</b>								
<b>Allen, 2014</b> <sup>42</sup> ROB: Serious	No difference with scribes versus no scribes	N=138 providers	Serious	Direct	Imprecise	Inconsistent	Undetected	Very Low <sup>a,b,c</sup>

<b>Arya, 2010</b> <sup>43</sup> ROB: Moderate	Increase in patients per hour with scribes (0.08 for every 10% increment of scribe usage during a shift)	N=401 shifts N=10531 patients N=26319 encounters						
<b>Graves, 2018</b> <sup>46</sup> ROB: Serious	Increase in patients per hour with scribes (2.81 vs 2.49)							
<b>Heaton, 2016</b> <sup>36</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Hess, 2015</b> <sup>47</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Shuaib, 2017</b> <sup>49</sup> ROB: Serious	Increase in patients per hour with scribes (3.2 vs 2.3)							
<b>Walker, 2016a</b> <sup>31</sup> ROB: Serious	Increase in patients per hour with scribes (1.13 vs 1.02)							
<b>Patient satisfaction</b>								
<b>Bastani, 2014</b> <sup>44</sup> ROB: Serious	Increase in patient satisfaction with scribes versus no scribes	N=799 shifts N=6559 patients N=23,319 encounters N=5 clinicians	Serious	Direct	Imprecise	Consistent	Undetected	Very low <sup>a,b</sup>
<b>Shuaib, 2017</b> <sup>49</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Walker, 2016a</b> <sup>31</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Dunlop, 2018</b> <sup>17</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Provider Satisfaction</b>								
<b>Allen, 2014</b> <sup>42</sup> ROB: Serious	No difference with scribes versus no scribes	N=799 shifts N=30,682 patients N=23,319 encounters N=155 clinicians	Serious	Direct	Imprecise	Inconsistent	Undetected	Very low <sup>a,b,c</sup>
<b>Bastani, 2014</b> <sup>44</sup> ROB: Serious	Increase in provider satisfaction with scribes versus no scribes							
<b>Hess, 2015</b> <sup>47</sup> ROB: Serious	No difference with scribes versus no scribes							
<b>Ou, 2017</b> <sup>48</sup> ROB: Serious	No difference with scribes versus no scribes							

<b>Shuaib, 2017<sup>49</sup></b> ROB: Serious	Increase in provider satisfaction with scribes versus no scribes							
<b>Walker, 2016b<sup>32</sup></b> ROB: Serious	No difference with scribes versus no scribes							
<b>Relative Value Units</b>								
<b>Arya, 2010<sup>43</sup></b> ROB: Moderate	Increase in relative value units per hour with scribes versus no scribes (MD=0.24)	N=1,050 shifts N=4,629 patients N=63,245 encounters N=103 clinicians	Serious	Direct	Precise	Consistent	Undetected	Low <sup>a</sup>
<b>Heaton, 2017b<sup>38</sup></b> ROB: Serious	Increase in relative value units per patient with scribes versus no scribes (4.04 vs 3.84)							
<b>Heaton, 2019a<sup>41</sup></b> ROB: Serious	No difference in mean relative value units per hour and patient with scribes versus no scribes (4.79 vs 4.72)							
<b>Hess, 2015<sup>47</sup></b> ROB: Serious	Increase in relative value units per hour and patient with scribes versus no scribes							
<b>Shuaib, 2017<sup>49</sup></b> ROB: Serious	Increase in relative value units per hour and patient with scribes versus no scribes (241 vs 336)							

ROB=risk of bias

<sup>a</sup>Downgraded 2 levels for risk of bias

<sup>b</sup>Downgraded 1 level for imprecision, difficult to interpret based on the variability in the reporting of the effects

<sup>c</sup>Downgraded 1 level for inconsistency
